While educational theorists and other scholars began to study the visitor experience in museums in the early part of the twentieth century,^[1–4] visitor studies did not fully emerge as a recognized discipline until the 1980s, roughly coinciding with the founding of the U.S.-based Visitor Studies Association (VSA) and its initial publications. This period also saw a substantial increase in the number of research studies related to visitor learning in museums and other informal contexts.^[5] These efforts to understand the impacts of museum programs and exhibits on visitors were driven largely by mandates from federal funding agencies to show accountability for grants received, but also out of recognizing the value of incorporating the “visitor’s voice” into museum exhibition and programmatic planning.

While requirements from funders still drive many studies, the field has continued to expand in the past several decades and many institutions now utilize visitor studies to help establish mission and goals, align programs and exhibits with mission, develop and refine visitor

experiences, and better meet the needs and interests of a diverse range of audiences. The field of visitor studies has addressed such issues as motivation for visitation, socially mediated learning, family learning, personal meaning-making, cultural relevance, the role of identity and memory in museum learning, and long-term impacts of museum experiences. In this entry, we will address the definition of visitor studies, the key theoretical foundations that underlie the field, goals and objectives of the field, commonly used research designs and methods, what we have learned about visitors in museum-like settings, and current trends in visitor studies research.

WHAT IS VISITOR STUDIES?

Visitor studies takes place within multiple disciplines, including museum studies, leisure and tourism studies, interpretation, informal science education, and environmental and conservation education, though it is considered by many an academic and professional discipline in its own right. In contrast to marketing, visitor studies provides the voice of the visitor, while marketing research aims to provide the visitor with what the visitor wants or expects. Visitor studies, however, allows for audience input into a system that is also driven by other criteria, such as curatorial and educator input, or alignment with the institution’s mission and goals. It is also important to note that visitor studies extends beyond actual visitors to a museum or museum-like setting, and can include the perspectives of potential visitors, non-visitors, or even a community as a whole.

The field of visitor studies is often divided into two key activities: 1) research and 2) evaluation, or applied research. While both research and evaluation use similar approaches and methods, they differ in their questions, goals, and applications. Basic research in visitor studies, as in any discipline, seeks to expand the knowledge of the

field and provide generalizable data—that is, knowledge that is not bound by one specific context or situation. This research can be hypothesis-driven (deductive) or emergent (inductive). Evaluation, on the other hand, seeks to answer specific questions about a particular population's experience of a specific exhibit, program, or other informal learning activity. The results of evaluation are not intended to be generalizable beyond the specific circumstances in which the study was carried out.

Evaluation is divided into three main stages: 1) Front-end evaluation, which is conducted in the early stages of planning and development, is designed to assess the needs, interests, and perceptions of potential visitors and non-visitors as a means to inform the planning process, test assumptions, and reveal visitors' awareness, knowledge, and understanding about a specific topic or idea; 2) Formative evaluation, which takes place during the development of an exhibition or program, when changes are still possible, aims to change or improve the exhibit or program based on visitors' responses, reactions, and behaviors (when a program or exhibit is completed and tested in full and in situ, the evaluation is referred to as "remedial" evaluation); and 3) Summative evaluation, which is carried out after an exhibit or program is considered complete, is designed to assess the effectiveness of the exhibit or program in reaching its intended goals and outcomes for visitors.

It is important to note that while visitor studies and evaluation are often thought of as synonymous, museum evaluation in itself does not necessarily include the visitor voice—it is only within the context of visitor studies that evaluation becomes visitor-centered. Evaluation is also a much larger field of study, reaching beyond museums, to focus on diverse educational and social enterprises. The American Evaluation Association (AEA) defines evaluation as "assessing the strengths and weaknesses of programs, policies, personnel, products, and organizations to improve their effectiveness."^[6] Indeed this is the role evaluation plays within visitor studies, but visitor studies is commonly thought of as being somewhat different from evaluation.

Multiple terms have been used to define the type of learning studied by visitor studies. One is "informal" learning, meaning learning that takes place outside a formal, structured environment such as school. Another commonly used term is "free-choice learning," which emphasizes the idea that individuals are generally choosing to spend time at places like museums, zoos, science centers, and gardens—or, even if they are taken there by someone else, such as a parent or grandparent, they make choices about where they go and what they do. In a free-choice learning environment, no curriculum guides the learning and visitors attend to what is interesting to them. Other terms commonly used in visitor studies are "non-formal learning" which is often used in environmental education to distinguish visitors who take part in defined

programming from those who self-explore, who are called informal learners; and "lifelong learning," which is used to emphasize this type of learning as taking place in informal settings across one's lifespan.

It should be noted that "informal" learning is referred to in other disciplines, such as sociology, as learning that takes place when sender and receiver of information have no learning or teaching agenda—for example, when people exchange information in conversations or through observing others in their daily life. Visitor studies looks at this particular aspect of learning only as it occurs within the walls of the institutions we study.

Another key component of this type of learning is that it is not measured or assessed through testing, as in formal education, and allows for multiple experiences and outcomes. Informal or free-choice learning is not entirely predetermined by the institution staff, but rather influenced by the environment that is created. This type of learning also differs from formal education as it occurs throughout one's lifetime in a variety of contexts. While visitor studies is focused on "learning" in informal contexts, the field defines learning in broad terms to include outcomes related to personal and social growth, building awareness, shifting attitudes, and affective or emotional responses—not just the cognition of "facts." The field recognizes that experiences in museum-like settings provide individuals with more than just the opportunity to learn new facts, but to make connections to themselves and to others, reinforce or challenge knowledge and ideas they already had, or to inspire curiosity or interest in new topics.

THEORETICAL FOUNDATIONS OF VISITOR STUDIES

Visitor studies has naturally drawn a great deal of its theoretical foundation from education and learning theory, as well as cognitive psychology and human development. We will briefly describe some of the key theoretical foundations here. The basis of all theories of knowledge and learning is the field of *epistemology*, which asks "What is knowledge?"^[7] Epistemological theories generally lie on a spectrum between two extremes: realism, which purports that there are objective truths in the world that can be known or learned by individuals; and idealism, which states that knowledge exists only in the minds of individuals and that there is no objective truth. Most theories of learning reside somewhere in between these two extremes.

One framework that has informed visitor studies is *behaviorism*. Descriptions of behaviorism focus on attempts to understand people's actions through observable behaviors in response to stimuli without regard to internal processes or mental states. In some visitor studies circles, this has led to the linking of behaviorism with the "transmission-absorption model" of communication,

whereby it is assumed that a fact or concept, if communicated well, will be understood by a target audience. Within visitor studies, behaviorism has influenced the development of methods designed to use observable behaviors as indicators for learning and other processes. A more commonly used framework in visitor studies is *constructivism*, which posits that learning occurs through the active participation of the learner, who “constructs” or makes meaning as they explore and discover.^[8] In other words, learning is highly personal, internally constructed, and based more in the process than in outcomes. Another key foundational theory used in visitor studies is *socioculturalism*, which asserts that an individual’s social world plays a significant role in how that individual interprets what they see, experience, and learn.^[9] In this perspective, it is crucial to examine the social and cultural context in which learning takes place in order to fully understand the processes and impacts of such learning.

More recently, researchers have explored learning theories such as social learning, in which learning is viewed as a social process where individuals build or “scaffold” on each other—rather than an individual pursuit. Often this social learning is explored through the analysis of conversations that groups have during museum visits.^[10] Within this realm, some researchers have focused specifically on family learning,^[11] or how intergenerational groups connect, interact, and learn from and about one another in informal learning contexts. Some researchers have focused specifically on youth learning, sometimes drawing upon *positive youth development* frameworks to understand the broader impacts of programs on the development of youth in relation to areas such as self image, confidence, social skills, compassion, empowerment, and civic engagement.^[12]

Researchers in visitor studies have also explored how identity and motivation might relate to learning, or to what degree and in what ways an individual’s “entry narrative” (or prior knowledge, perspectives, interests, and motivations for visiting) impact what and how they learn, and the degree to which identity plays into the experience of learning itself.^[13–16] Other theoretical pursuits include the role of memory as a precursor to impacts; that is, the role of the museum in the construction of the self and “possible selves” (who one can become, both personally and professionally) over the course of one’s lifetime.^[17] Another lens recently used by researchers in visitor studies is that of long-term impacts, or how experiences in informal learning contexts may affect an individual over time. The idea behind this perspective is that the impacts of a museum visit do not all occur during or immediately after the experience, but may develop and shift for days, weeks, months, or years beyond it.

At the applied level, visitor studies often uses program theory to structure experiences that align goals and objectives with activities, in order to achieve specific outcomes. A process of *logic or program modeling* is used to help

institutions plan or reflect upon the ways in which their mission is reflected in their outputs (or activities and products) and, ultimately, in visitor outcomes. Drawn from the field of program evaluation, this technique helps the researcher and the program staff to verify that the program accomplished what it sets out to do. Program modeling helps institutions understand to what degree activities and actions provided are linked to visitor outcomes.

GOALS AND OBJECTIVES OF VISITOR STUDIES

The overarching goal of visitor studies is to bring the “visitor voice” to the table when it would not otherwise be present. That is, as museums and other informal learning institutions engage in planning, development, and alignment of their mission with outputs and activities, visitor studies allows these institutions to incorporate the perspective of current and potential visitors, as well as non-visitors, into these processes. It is important to recognize that the work of visitor studies is not prescriptive; it does not tell institutions what to do or how to do it, but serves as a tool by which to inform them of how visitors and non-visitors think and feel about a given experience (e.g., exhibit or program), concept, topic, or even the museum as a whole, as well as to measure the effectiveness of an exhibit or program, and underlying mechanisms that support or hinder visitor engagement.

Visitor studies can be viewed as supporting four main, though not necessarily distinct, objectives: 1) providing valuable information on the effectiveness or impacts of a specific exhibition or program; 2) supporting visitor learning more broadly, including a wide range of audiences based on type of group (e.g., families or intergenerational, school groups, the elderly), cultural background, personal interests, prior knowledge, or identity; 3) informing strategic and interpretive planning for informal learning organizations; and 4) increasing our knowledge of how, where, what, and why people choose to learn in their spare time across their lifespan.

One of the most basic objectives of visitor studies is to provide feedback, from the visitors’ perspective, on specific museum experiences, most often an exhibition, exhibit component, interpretive strategy, or program. In this way, visitor studies supports informal learning institutions in creating accessible, relevant, and valuable experiences that align with institutional goals and mission. Essentially, visitor studies can be used in very specific, targeted ways to assess the nature or impacts of a particular experience.

Another primary goal of visitor studies is to more broadly support the needs and interests of a wide range of visitors. Museums were historically designed and developed as collecting institutions and were not concerned with the value of those collections vis-à-vis the general public. Even as museums became more aware of

themselves as important learning institutions in the first half of the twentieth century, exhibits and programs were largely created from the curatorial perspective with little understanding of visitors' wants, needs, or prior knowledge related to a given topic. In more recent years, visitor studies has been recognized as an essential practice in understanding and supporting the broad range of needs, interests, and learning styles of museum visitors and visiting groups.

Through the accumulation of knowledge about the visitor experience in museums, professionals engaged in visitor studies have increasingly served the role of informing institution-wide strategic and/or interpretive planning efforts. Often focusing on more than one specific exhibition or program, the objective of these efforts is to help institutions think more broadly about the audiences they serve, approaches to engaging new audiences, and how to integrate visitor perspectives throughout all levels of the institution. In this capacity, visitor studies provides empirically based knowledge (through research, evaluation, and/or literature reviews) that supports informal learning institutions in making crucial decisions about exhibition design, interpretive approaches, and public outreach and education strategies.

Finally, one of the underlying objectives of visitor studies is to increase our general knowledge of how people learn, what motivates them to learn, the types of factors that influence learning (such as an individual's "entry narrative"—which includes prior knowledge, experience, attitudes, and reasons for visiting), and the role of the sociocultural context in which learning takes place. This knowledge adds to our understanding of the significant role that museums and museum-like settings can play in people's lives across their lifespan.

VISITOR STUDIES AS A PROFESSION

Visitor studies as a profession in its own right emerged in the 1970s and 1980s. One of the early visitor studies-focused publications, *Visitor Behavior*, was first published in 1986. The journal exemplified the need for those already engaged in visitor studies to create a space for communicating findings and supporting professional practice.^[18] Two years later, in 1988, VSA was founded and held its first conference.^[19] At this first conference, a major goal was to identify indicators that visitor studies had emerged as a distinct field, including a critical mass of professionals involved in visitor studies, institutional commitment to the field, and a literature base.^[20] VSA became the publishing organization for *Visitor Behavior*, the full archives of which can be accessed through the VSA Web site (<http://www.visitorstudies.org>). Concurrently, the field of evaluation also coalesced into a recognized discipline, as exemplified by the first annual conference of the AEA in 1986.^[21]

Since the 1980s the field of visitor studies has become increasingly professionalized and academically minded. Developments include the creation of the Committee on Audience Research and Evaluation (CARE) within the American Association of Museums (AAM) and the committee's authoring of professional standards of "competent and responsible support and practice of visitor studies."^[22] A continuing concern facing the field is supporting and ensuring professional practice by identifying key competencies and hosting professional development workshops. In another parallel with the broader evaluation field, visitor studies professionals and organizations have pushed for a formalized system of credentialing professionals. Unlike evaluation or museum studies, which are degree granting fields taught at universities, visitor studies as such has no degree program at this time. However, there are advanced degree programs in informal learning, such as through the Center for Informal Learning and Schools, a partnership of the Exploratorium, King's College London, and UC Santa Cruz (<http://cils.exploratorium.edu>), University of Pittsburgh's Center for Learning in Out of School Environments (<http://upclose.lrdoc.pitt.edu/>), and the program in Free-Choice Learning at Oregon State University (<http://seagrant.oregonstate.edu/freechoice/index.html>).

Major associations and conferences that present visitor studies and support the profession include VSA, AAM, the Association of Science-Technology Centers (ASTC), the Association of Zoos and Aquariums (AZA), American Educational Research Association (AERA). Journals that publish visitor studies include *Visitor Studies* (published by VSA), *Curator*, *Science Education*, *The Journal of Museum Education*, *Informal Learning Review*, *Environmental Education Research*, and *Museums & Social Issues*.

RESEARCH DESIGN AND METHODOLOGY

As is typical in social science-based research and evaluation, visitor studies may use quantitative or qualitative research designs or use a mixed-method approach. A review of the literature is recommended before the study is begun to ground the study in what is already known about the subject. Given the interdisciplinary nature of visitor studies, researchers tend to review literature from a wide range of disciplines for any one study they undertake. Theories from the social sciences may inform the lens the researcher uses to frame their investigation (e.g., behaviorism, constructivism, socioculturalism), to provide focus to the subject of the investigation or to interpret the data.

While research designs can be broadly categorized as quantitative, qualitative, or mixed, it is important to note that specific methods used to gather data (such as surveys, interviews, and observations) are not for the most part tied

to being quantitative or qualitative, and can be analyzed through either lens, depending on the nature of the research or evaluation questions.

Quantitative Research Designs

Quantitative research designs are commonly used in visitor studies. These studies may use experimental, quasiexperimental, or nonexperimental designs. Experimental designs usually compare two different treatments based on random assignment to the treatments. This design is more likely to be used in a laboratory-type setting, rather than on the museum floor, because it allows for greater control of the experience by the researcher. An example of an experimental design could be asking two or more groups to complete the same task but some element of the experience is varied, like the signage, for each group. Quasiexperimental designs also use two or more treatments, but the treatments are not based upon individual random assignment. Instead, a matched-sampling technique may be used, as is common in studies of school groups where two similar classrooms or schools are matched together, each receiving a different treatment. Nonexperimental quantitative designs use no comparison groups or multiple treatment types. This design is commonly used in surveying visitors as they complete an exhibition or program. The sampling technique used may or may not be random, depending on the nature of the research question(s) being asked.

Quantitative research designs use methods that allow for statistical analysis and the reporting of numerical data. Surveys, interviews, observing visitor behavior, and visitor tracking are used to gather quantitative data about visitor's knowledge, attitudes, and behaviors. SPSS and SAS are social science software packages designed for the analysis of quantitative data, although Microsoft Office applications may also be used.

Qualitative Research Designs

Qualitative research designs are commonly used in visitor studies. Qualitative research designs are used to uncover the meanings behind events, gather perspectives from participants, and find out how or why something occurred. Qualitative designs are intended to contextualize events, people, and behaviors. All qualitative study designs have in common the use of techniques which generate word-based descriptions that attempt to capture "thick descriptions" of people, events, or phenomena.^[23] While multiple types of qualitative methodologies have been identified,^[24] case studies and ethnography are used most frequently.

Qualitative methods include interviews, observations, focus groups, and other methods to generate textual data that is not analyzed numerically. These data may be analyzed using techniques of pattern, theme, and content

analysis.^[25] Specifically designed software such as Atlas.ti, HyperRESEARCH, NUD*IST and NVivo are becoming more common tools for qualitative data analysis as the capabilities of the software improve.

Mixed Method Research Designs

Mixed method studies use both qualitative and quantitative methods within a single study. Methods may be combined to use the strengths of both quantitative and qualitative approaches or for triangulation of data. For example, both tracking and interviews may be combined in an attempt to understand how visitors utilize an exhibition, with one set of data confirming, supporting, or enriching the other. Mixed method studies are often nested or iterative, meaning the project is multistage and one study builds upon another. A good example of this would be using an open-ended interview to explore an idea with a limited number of visitors and then a close-ended survey to gather more generalizable data, or using a survey with visitors as they leave an exhibition and following up months later with an open-ended telephone interview.^[26]

WHAT WE KNOW ABOUT VISITORS

Who Visits and Why Do They Visit

Other than the number of tickets sold on an annual basis, museums often have very little detailed information about their visitors. In the United States, organizations such as AAM, AZA, and ASTC annually survey their member institutions. This information adds to our knowledge about who visits these institutions, as well as field-wide differences. For example, zoos commonly have higher attendance than other types of museums and attract a larger number of families.

Over the last 30 years, statistics have shown that museum visitors are well-educated, have relatively high incomes compared to the rest of the population, and are usually White/Caucasian. According to the National Science Board, roughly 60% of the population averages three visits a year to museums.^[27] These trends in attendance are relatively stable over time and across multiple countries. A study comparing Southern Californian museum visitation in 1984 and 2005 found that despite the increasing percentage of Latinos in the general population, museum visitors were no more likely to be Latino; instead Caucasians made up the majority of museum visitors in both 1984 and 2005.^[28] However, a critical factor that is more relevant in predicting who will visit is childhood visitation. Regardless of education or income, visiting museums as a child with one's family has a positive correlation with visitation as an adult. Note that school visitation as a child does not have the same impact on adult museum-going habits as visiting with one's family.

Marilyn Hood undertook some of the field's original studies into who visits museums, who does not, and why. Non-visitors do not visit because the message or value of the museum has not been communicated to them.^[29] In a study of visitors, occasional visitors, and non-visitors in the Toledo, Ohio, area, Hood found that non-visitors valued leisure experiences that allowed for social interaction, active participation, and feeling comfortable in their surroundings, and did not visit museums because they felt museums did not encompass these attributes.^[30] Recent studies have shown that non-visitors perceive specific museums as not being culturally relevant and also hold negative preconceptions about museums in general.^[31]

Visitors come to museums and museum-like institutions for a range of reasons. While museum professionals often think of their institutions primarily in terms of the educational mission, visitors think of much more than education. Museums are seen as a place for entertainment, spending quality time with family and friends, a “must-see” destination, or even a place to go to get out of the rain or the summer heat. The field of social psychology has much to share with researchers investigating visitor motivations. Underlying these reasons for visiting a museum are issues of self-determination, self-fulfillment, and intrinsic motivation.^[32,33] People visit museums because they find something appealing or rewarding in the visit. Visiting is an intentional behavior that allows for the fulfillment of desires or perceived needs, all within an enjoyable setting.

What Are the Outcomes of the Visit

Just as a range of reasons for visiting have been identified, a range of outcomes have also been identified by the field of visitor studies. These outcomes are grouped under the heading of “learning” and include knowledge, affective responses, and behaviors. Visitor studies traditionally emphasized the knowledge-based or cognitive outcomes from a visit. Museum practitioners wanted to know how much of the main message or big idea of the exhibition or program visitors could express at the end of their visit. Visitor studies supplied the data that allowed designers to see how many visitors “got” the exhibition.

As the field grew, researchers pushed the boundaries of what counted as “learning” in or from an experience. Books like *Family Learning in Museums* and *Learning Conversations in Museums* and the Contextual Model of Learning posited by Falk and Dierking embraced the idea that visits do more than impart factual knowledge to visitors.^[34–36] Recent discussions in publications like *Informal Learning Review*, *Science Education*, and *Environmental Education Research* broadened the perspective of possible and desirable outcomes further.^[37–39]

Learning during and after a visit is embedded in the social and physical contexts of the visitor. With this broadened view of what learning is and how it occurs,

researchers began to look more broadly at learning outcomes from a visit. Current studies are just as likely to investigate emotional or affective responses as cognitive gains. Affective responses include attitudes and perceptions towards an exhibition itself or the content. How did a visitor feel about modern art before, and after, an exhibit?

Visitor studies research also investigates visitor behaviors during and after the visit. Behavior change is an important facet of many conservation-focused institutions such as zoos or aquariums. These organizations have a strong interest in teaching their visitors about the wildlife in their collections, and how human activity impacts the ecosystems of these organisms in the wild. These institutions, however, commonly attempt to leverage this knowledge of nature and ecosystems to have their visitors make a change in their behavior: recycle, use less water and energy, donate to WWF, or write their congressperson. The field of visitor studies is just beginning to tap into the wealth of knowledge on behavior change from other fields. Drawing from fields such as health, psychology, and environmental education, the interdisciplinary nature of visitor studies allows researchers to seek out theories that have been formulated in other fields and apply them to visitor studies.

One can state that most experiences that are researched by visitor studies are of relatively short duration, and hence the relative intensity of individual impacts is sometimes rather small: latent knowledge is brought to the fore, awareness is raised, emotional connections are made, enjoyment and fulfillment is reached, a sense of belonging is rekindled, or quality family time is spent. In contrast to school assessment, visitor studies often deals with small changes on the individual level that, aggregated over many visitors, amount to considerable benefits to society. Few experiences that visitor studies concerns itself with are transformative for individuals alone, and those tend to come from programming that is longer-lasting and more involved, like volunteering as an interpreter in a museum or taking part in a citizen-science project. A new field in visitor studies is focusing on the value of entire institutions to their community and on the relative contribution of individual experiences within a stream of lifelong engagement in leisure-time learning. It is within these contexts that the field of visitor studies is able to document the benefits of lifelong, informal, or free-choice learning.

CURRENT RESEARCH TRENDS IN VISITOR STUDIES

As more is learned about visitors and why they come, we realize how much there is that we do not know. The boundaries of the field have been sketched and now there is a real push to add to the depth of knowledge. Researchers have been pushing for more longitudinal

studies, more investigations into the role of social groups in learning, and personal factors such as motivations and identity. This is not to say that researchers have overlooked these issues, only that the field as a whole needs to know more about the role of these factors in visitation and the impacts of visitation.

Longitudinal studies allow researchers to learn more about aspects having to do with on-going behaviors or outcomes of a visit. For example, a study conducted six months after a visit to an aquarium allows researchers to ask questions about whether behavior change *actually happened*, whereas at the time of the visit only a visitor's *intention* to change can be documented.^[40] A recent review of long-term visitor studies pointed out, however, that there are few such studies and most look at a relatively short length of time (i.e., a year or less).^[41] The field needs to undertake more longitudinal studies and studies of greater temporal length. These types of studies will allow the field to say with more certainty what the impacts of visitation really are and how museum visits fit into the fabric of a person's life.

Likewise, more research is needed on how the outcomes of a visit are mediated by the social group with which one visits. Both what and how people learn is impacted by the social setting in which the learning takes place. People within groups talk about their own experiences in relation to what they are seeing, they draw upon the skills and memories of others, and the act of visiting creates another shared experience among the group. In light of the fact that most museum visitors come to the museum as part of a social group, visitor studies research has only just begun to touch upon the social aspects of visiting, learning, and visit outcomes.

Greater investigation into personal aspects such as motivations and identity are also needed in the field of visitor studies. Recent studies and discussion in the field have described motivations for visiting in terms of the enacted or situated identity of the visitor. In one recent study, researchers grouped zoo and aquarium visitors into five identity-related motivations (explorer, facilitator, experience seeker, professional/hobbyist, and spiritual pilgrim) and found that slightly more than half (55%) of those interviewed had a single strong motivating factor for their visit.^[42] These conversations hearken back to the reason why people choose to visit in the first place. What do we really know about how a museum visit supports a person's view of themselves? By continuing to draw from the theories and results of diverse disciplines, researchers will add to our knowledge of what drives visits to museums.

The field of visitor studies also is under increasing pressures from forces outside the field. Funding agencies such as the National Science Foundation and the National Institutes of Health play a role in shaping the practices of the field, both the questions that are asked and the way the research is conducted. Recent trends include the push for

rigorous studies as defined by the U.S. Department of Education Report of the Academic Competitiveness Council from May 2007 (mostly experimental or quasiexperimental research designs), and the enforcement of federal regulations guiding the protection of human subjects in research in educational settings that had previously not focused on these issues (NSF-ISE, NIH-SEPA).^[43] Professional associations like VSA and AEA are working to actively shape policy and let funding agencies know how these changes effect how visitor studies are conducted.

CONCLUSION

Visitor studies have impacted the way museum practitioners view their visitors and, therefore, the types of experiences that are created. Whether through evaluation or basic research, visitor studies pushes the museum field to learn more about why visitors come to these institutions and what happens during and after the visit. Visitor studies are increasingly being used to frame the importance of learning throughout the lifespan.

Visual and Performing Arts Archives

Francesca Marini

*School of Library, Archival and Information Studies, University of British Columbia,
Vancouver, British Columbia, Canada*

Abstract

This entry offers a brief introduction to visual and performing arts archives. It discusses some of the main issues concerning the creation, archiving, and management of visual arts and performing arts materials, it lists examples of materials and of repositories in which they are held, and it points to professional associations and resources in these fields.

INTRODUCTION

Visual arts may be defined as “the arts created primarily for visual perception, as drawing, graphics, painting, sculpture, and the decorative arts” (s.v. “visual arts”).^[1] The performing arts may be defined as “arts or skills that require public performance, as acting, singing and dancing” (s.v. “performing arts”).^[1] These simple definitions are appropriate for the purpose of this entry, although they might be greatly broadened and made more articulate, according to the very complex discussions and competing points of view that exist in the visual and performing arts worlds. A full list of visual arts is almost impossible to compile. Other examples that may be added to the ones above include architecture, photography, design, illustration, installation, video art, digital art, cartooning, and comic art. The notion of performing arts expands to include live events such as theatre, dance, music, opera, musical theatre, pantomime, puppetry, circus, and fairs, and events that imply recording, such as film and broadcast. Live and recorded elements of course may merge in the same event, as it happens, for example, in multimedia theatre and digital performance. Canadian performance scholar Catherine Graham writes that nowadays the boundaries “between theatre and other art forms, between recorded and live...forms of dramatic performance are increasingly blurred, both in practice and in theory” (p. 3).^[2] Performance art is considered one of the visual arts (s.v. “visual arts”),^[3] but has also a key place in the larger world of performance.^[4] Film may be considered part of both the visual and the performing arts. The various activities carried out in the visual and the performing arts produce materials with different functions and in different formats. Many of these materials end up in archives. Archives preserve memory and the records “created and received in the course of individual or institutional activity and set aside (preserved) as evidence of that activity” (s.v. “record”),^[5] as well as “for action or reference” (s.v. “record”).^[6] The word “archives” may designate: the

whole of the holdings, and be therefore used as a plural with a singular article (“an archives”); the institution that manages the holdings (e.g., The U.S. National Archives and Records Administration); the physical space in which the holdings are kept (see Pearce-Moses,^[5] s.v. “archives”). The goal of this entry is to offer a brief introduction to issues concerning the archiving and management of visual arts and performing arts materials, to list examples of materials and of repositories in which they are held, and to point to professional associations and resources in these fields. The entry opens with a brief discussion of how visual and performing arts materials come into being, and it presents examples of materials and of repositories in which they may be held (“Visual and Performing Arts Materials: Creation, Types and Repositories”); it then briefly discusses some key issues in relation to the archiving and management of visual and performing arts materials (“Archiving and Managing Visual and Performing Arts Materials: Selected Issues”). Finally, it summarizes the main issues (“Conclusion”), and points to selected references cited in the text or recommended for further reading.

VISUAL AND PERFORMING ARTS MATERIALS: CREATION, TYPES, AND REPOSITORIES

In archival theory and practice it is key to understand the context of the materials (s.v. “context”).^[5] For example: who created them, how, and why; what their original use was; how they were organized; what relationships exist among the materials originating from the same individual or institution; what happened to the materials over time; and more. Many people and institutions are involved in the creation; for example, artists, directors, theatre companies, film studios, galleries, managers and impresarios, costume and set designers, lighting designers, technical staff, marketing staff, the audience, and more. Visual and performing arts materials are born from both individual

and collaborative efforts; collaboration is an essential aspect of the performing arts, and is also a strong element in the visual arts. Materials may relate directly to a specific outcome or event (such as a visual art creation or a theatre performance); to a specific creator (such as a painter or an actor, or a company/studio/gallery); or to several events and creators at once. Materials may therefore relate to specific individuals, institutions, outcomes or events, or to a combination of all these. Materials may remain with their original creator or they may be transferred elsewhere; they may have a very complex life, existing in different places and with different purposes at different points in time. Some examples:

- American theatre artist Robert Wilson maintains his own archive, The Robert Wilson Archive at the Byrd Hoffman Water Mill Foundation; he has also donated videos of his performances to the Theatre on Film and Tape Archive of the New York Public Library for the Performing Arts and part of his papers to the Columbia University Rare Book and Manuscripts Library.^[7]
- A substantial part of the personal papers of Austrian-born actor and director Eric von Stroheim first stayed with him and then with his family for decades, until the family donated them to The Margaret Herrick Library of The Academy of Motion Picture Arts and Sciences in Los Angeles in 2002.^[8]
- American artist Romare Bearden donated his papers to the Smithsonian Institution Archives of American Art between 1977 and 1983.^[9]

Visual and performing arts materials originate from a complex process. Australian performing arts librarian Richard Stone writes that:

Common to all the performing arts is a progression from creative impulses and inspiration, to preparation and execution, to the ultimate performance/s before an audience. At any point of this process objects, documents and publications are generated. All of them are potential for heritage consideration, for being collected and preserved. (p. 31)^[10]

With a slight modification, the above paragraph may also be applied to the visual arts. The process of creation is of course not necessarily linear and sequential in time, and the stages described above should be seen as possibly recurring and overlapping. Many materials originate from the creative and technical processes that ultimately lead to visual art creations and to performances. The process is as important as the final product, therefore all materials are potentially relevant for preservation in archives, and archivists need to thoroughly understand the process in order to acquire and manage the materials.^[11] The final outcome is not always fixed in form: for example, a live performance such as a concert, a ballet, or a spoken-word show is never exactly the same in its different instantiations; a digital

performance may change depending on technical considerations; and an installation may adapt to different environments. The final outcome may or may not be in the archives. For example, a painting might be in a private home, a gallery, or a museum, although some paintings end up in archives. Live performances cannot be in an archives, because they do not survive in their entirety after being performed, although recordings of them often exist in archives. Digital performances may sometimes be preserved, although with difficulty; in these cases, they may be held in archives. Film and broadcasts are usually held in archives. In terms of types and formats of materials, archivists need a broad understanding of: the materials generated in the course of the creation process (e.g., sketches of a painting or of the costumes for a show); the final outcomes of the process (e.g., a painting, or costumes for a show); and the entire variety of materials related to the final outcomes (e.g., the correspondence of a painter, a contract with a costume designer, posters advertising a show). Different types of repositories may hold different materials.

To try and visualize how materials are created and where they are kept, we can make a couple of hypothetical examples. An artist may create a painting in his studio having his wife as a model; the artist may be part of a movement or a creative group; the painting may be commissioned by a gallery, shown in an exhibition and then sold to an art collector; when the collector dies, his family may decide to donate the painting to a museum. Besides the work of art in itself, many other materials are created through time in the course of this process. Some examples may be: sketches of the painting; diaries by the painter or his wife discussing the experience; photographs of the wife posing as a model for the painting; correspondence with other artists who are part of the same movement or group; legal correspondence with the gallery that commissioned the work; documentation of the exhibition, in form of photographs, newspaper accounts and critic reviews, advertising materials such as posters and promotional postcards, and more; contracts and papers detailing the sale of the work to a collector; papers regarding the donation of the work from the collector's family to a museum, and more. These are only a few examples of materials related to the creation and life of a specific work of art, which may end up in archives. The sketches, diaries, photographs and correspondence would be part of the artist and artist's wife archives; copies of the legal correspondence with the gallery and documentation of the exhibition might exist in both the gallery's and the artist's archives; copies of papers concerning the sale of the work to a collector would exist in both the collector's and the gallery's archives; copies of papers regarding the donation to a museum would exist in both the collector's family archives and the museum archives; and so on. Of course, the artist's/gallery's/collector's papers could eventually be acquired by the museum that ultimately got the work, or

by another archives, institution, or foundation. Archives in the strict sense of the term, made only of materials preserved because of their enduring value (s.v. “archives”),^[5] will not exist in every case; individuals and institutions sometimes keep too much or too little. A theatrical production may produce a great deal of materials. For example: A playwright writes a play; the play is based on personal experience and on research, of which a documentation is kept; several drafts of the play are composed before getting to the final version; the play has been commissioned by a theatre. The theatre produces the play for its new season; the theatre is of course a very complex organization, with a structure encompassing administrative, legal, financial, artistic, technical, educational, marketing, and publicity requirements and activities. Among those specifically employed in the production there are actors and dancers, the director, the dramaturg (who is not the author of the play, but the one who analyzes and explains a play in view of its staging), the playwright, the costume designer, the set designer, the lighting designer, the composer, the production manager, and more. In different degrees, all of these people base their work on research and preparatory work, which produces documentation; they then create materials in the course of the production (annotated scripts and promptbooks, notes, videos of rehearsal, sketches, charts, scores, props, costumes, and more). The production is of course supported by all of the theatre’s administrative, management, and technical staff, with all the materials that this entails. Among the many activities, it is advertised (with posters, news releases, photographs, and more) and explained to the audience (e.g., in the programs, in summaries and analyses posted on the theatre’s Web site, and more). Once the production opens, it is video-recorded and photographed (in the course of a regular performance in front of the audience, or during a performance staged just for this purpose); it is reviewed by critics; it is discussed by the audience; it tours in different cities and countries, maybe with changes in cast, or in other aspects, such as the costumes; and more. Performances in a production are not identical and differ from one another, according to several factors (performers, audience’s reactions, and more). Once a production is over, some of the materials created in relation to it are re-used, while others are discarded. For example, set designs may be used in another show, as they are or with some alterations; or they may simply be discarded. The same thing may happen with costumes. In some productions costumes and sets are especially created, while in others they are simply rented. Advertising materials such as posters and programs may easily disappear. As in the first example discussed above, the materials are many and complex, and may belong to different archives at different stages. The playwright’s drafts, notes, research materials, and copies of the correspondence with the theatre will initially stay with her, and may later be donated to an archives. The materials related to the production and chosen for long-term preservation

will stay in the theatre’s archives, if the theatre has one, or will go to another archives (e.g., a city archives) once they have served their initial purpose. Costume and set designers’ sketches will stay with the theatre if theirs was a work for hire, or will stay with the designers. Some of the actors’ and director’s notes and papers will likely stay with them initially, and so on.

Visual and performing arts materials, of both local and international relevance, will therefore be part of a variety of archives, including personal archives, in-house archives (such as the archives of theatres and galleries), archives of art and research institutions, archives of foundations, university archives, municipal archives, national archives, and more. Visual and performing arts materials will also be present in a variety of special collections in libraries. The next section presents some examples of repositories.

Examples of Repositories

Among national repositories, examples are

- The U.S. National Archives and Records Administration (NARA) (<http://www.archives.gov/>; accessed August 12, 2008) has several relevant holdings, including: Motion Picture Films and Sound and Video Recordings (<http://www.archives.gov/research/formats/film-sound-video.html>; accessed August 12, 2008); Cartographic and Architectural Records (<http://www.archives.gov/research/formats/cartographic.html>; accessed August 12, 2008); Photographs and Graphic Works (<http://www.archives.gov/research/formats/photographs-dc.html>; accessed August 12, 2008).
- Library and Archives Canada (LAC)/Bibliothèque et Archives Canada (BAC) (<http://www.lac-bac.ca/>; accessed August 12, 2008) has many relevant holdings, including: moving image; architectural records; photographs; sound recordings; music documentation; works of art; and personal papers.^[12]
- The Library of Congress (<http://www.loc.gov/index.html>; accessed August 12, 2008) has several relevant departments, including: The American Folklife Center (<http://www.loc.gov/folklife/>; accessed August 12, 2008); the Motion Picture, Broadcasting and Recorded Sound Division (<http://www.loc.gov/rr/mopic/>; accessed August 12, 2008); the Music Division (<http://www.loc.gov/rr/perform/>; accessed August 12, 2008); and the Prints and Photographs Division (<http://www.loc.gov/rr/print/>; accessed August 12, 2008).
- The Smithsonian Institution in Washington, District of Columbia, encompasses several research units, including: the Archives of American Art (<http://www.aaa.si.edu/>; accessed August 12, 2008); the Smithsonian Institution Archives (<http://www.siarchives.si.edu/>; accessed August 12, 2008); the Smithsonian Institution Libraries (<http://www.sil.si.edu/>; accessed August 12, 2008); and the Ralph Rinzler Folklife Archives and Collections,

part of the Smithsonian Center for Folklife and Cultural Heritage (<http://www.folklife.si.edu/center/archives.html>; accessed August 12, 2008). The Smithsonian also houses extremely large photography collections (<http://photography.si.edu/>; accessed August 12, 2008).

- The British Library's (<http://www.bl.uk/>; accessed August 12, 2008) relevant departments include the Music Collections (<http://www.bl.uk/reshelp/bldept/music/index.html>; accessed March 26, 2009), and the British Library Sound Archive (<http://www.bl.uk/nsa>; accessed March 26, 2009).
- La Bibliothèque nationale de France (BnF) (<http://www.bnf.fr/default.htm>; accessed August 12, 2008) has many relevant collections and departments, including: the Département des Arts du Spectacle, the Département de la Musique, the Département de l'Audiovisuel, the Département des Estampes et de la photographie, and the Bibliothèque-Musée de l'Opéra (<http://www.bnf.fr/pages/zNavigat/frame/collections.htm?ancre=arts.htm>; accessed August 12, 2008).

Among dedicated repositories, examples are

- The Research Institute of The Getty in Los Angeles (<http://www.getty.edu/research/>; accessed August 12, 2008); its Research Library holds general library collections, special collections, and a Photo Study Collection, with a focus on "the history of art, architecture, and archaeology with relevant materials in the humanities and social sciences"^[13] (http://www.getty.edu/research/conducting_research/library/index.html; accessed August 12, 2008).
- The Museum Archives (<http://moma.org/learn/resources/archives>; accessed March 15, 2009) of the Museum of Modern Art (MoMA) in New York City (<http://moma.org/>; accessed August 12, 2008) holds documentation on the Museum's activities, and on aspects of modern and contemporary art. There are also several study_centers at MoMA; they include the Lily Auchincloss Study Center for Architecture and Design, The Drawings Study Center, the Joseph and Sylvia Slifka Painting and Sculpture Study Center, Erna and Victor Hasselblad Photography Study Center, The Abby Aldrich Rockefeller Print Room, the Celeste Bartos International Film Study Center, as well as The Celeste Bartos Film Preservation Center in Hamlin, Pennsylvania (http://moma.org/learn/resources/study_centers; accessed March 15, 2008).
- The Academy Film Archive (<http://www.oscars.org/filmarchive/index.html>; accessed August 12, 2008) and The Margaret Herrick Library (<http://www.oscars.org/library/index.html>; accessed August 12, 2008) of The Academy of Motion Picture Arts and Sciences in Los Angeles (<http://www.oscars.org/>; accessed August 12, 2008) are, together with MoMA, among the largest film repositories in the world.
- The George Eastman House International Museum of Photography and Film (<http://www.eastmanhouse.org/>; accessed August 12, 2008) promotes many activities and has a world-famous museum of photography and film archives (http://www.eastmanhouse.org/inc/the_museum/welcome.php; accessed August 12, 2008). Its collections include photography (<http://www.eastmanhouse.org/inc/collections/photography.php>; accessed August 12, 2008), motion picture (http://www.eastmanhouse.org/inc/collections/motion_picture.php; accessed August 12, 2008), and photographic and cinematographic equipment (<http://www.eastmanhouse.org/inc/collections/technology.php>; accessed August 12, 2008). The Richard and Ronay Menschel Library is part of The George Eastman House and focuses on photography and motion picture (<http://www.eastmanhouse.org/inc/collections/library.php>; accessed August 12, 2008).
- The New York Public Library for the Performing Arts (<http://www.nypl.org/research/lpa/lpa.html>; accessed August 12, 2008) "houses the world's most extensive combination of circulating and non-circulating reference and research materials on music, dance, theatre, recorded sound, and other performing arts."^[14] The Circulating Collections include: Arts Administration; Dance; Drama; Music; the Orchestra Collection; Recorded Sound and Moving Image.^[15] The Research Collections include: the Jerome Robbins Dance Division; the Music Division; the Rodgers and Hammerstein Archives of Recorded Sound; and the Billy Rose Theatre Collection.^[15] The Theatre on Film and Tape Archive (TOFT), championed by Betty Corwin, is part of the Billy Rose Theatre Collection and, since 1970, "has been engaged in a unique documentation effort"^[16] recording theatre productions and documenting theatre personalities.
- The Metropolitan Opera (The Met) Archives in New York City (<http://www.metoperafamily.org/metopera/history/>; accessed August 12, 2008) are "devoted mainly to Met history and the holdings consist of written record, photographs, costumes, art works and related material."^[17]
- The Harvard Theatre Collection (<http://hcl.harvard.edu/libraries/houghton/collections/htc.html>; accessed August 12, 2008) is part of the Houghton Library at Harvard University in Cambridge, Massachusetts, and documents the history of the performing arts. The Harvard Theatre Collection is considered "the oldest major theatre collection in the world."^[18]
- The National Theatre Archive (<http://www.nationaltheatre.org.uk/?lid=7058>; accessed August 12, 2008) "is the repository for the administrative and technical records of the National Theatre" in London, United Kingdom.^[19] The National Theatre has developed a Web site about its productions and educational activities, Stagework (<http://www.stagework.org/stageworks/index.html>; accessed August 12, 2008).

- La Bibliothèque-musée de la Comédie-Française in Paris, France (http://www.comedie-francaise.fr/dev/institution_bibliotheque-musee-infos.php; accessed August 12, 2008) houses archives, iconographic materials, publications, artworks, and three-dimensional objects related to the history and activities of the Comédie-Française.
- The Biblioteca e Raccolta Teatrale del Burcardo (Burcardo Library and Theatre Collection) in Rome, Italy (<http://www.burcardo.org/english/index.htm>; accessed August 12, 2008) is “an office of the Italian Society of Authors and Publishers - SIAE”^[20] and houses special collections, a library, and a museum, as well as the SIAE Historical Archives. Its holdings are among the largest in Italy.

There are several portals, lists, and directories that point users to visual and performing arts archives and special collections. One example is the *SIBMAS International Directory of Performing Arts Collections and Institutions*, available through the SIBMAS Web site (<http://www.sibmas.org/>; accessed August 12, 2008).

Many archives also digitize some of their materials and make them available as online collections. Archives and institutions often develop online exhibitions, too. Some archives and institutions also use theirs and other materials to develop projects and Web sites for education and outreach.

ARCHIVING AND MANAGING VISUAL AND PERFORMING ARTS MATERIALS: SELECTED ISSUES

Archivists working with visual and performing arts materials follow the general principles and practices of their profession, but also need to tailor them to the specificity of the materials. This section will briefly address some key aspects of visual and performing arts archivists' work. For a more complete discussion, readers may refer to the works cited in the references and bibliography sections, as well as to the Web sites of institutions and associations mentioned in this entry.

How do you document the visual and performing arts? Their complexity and dynamic characteristics make it in most cases impossible to thoroughly document all of their aspects. Especially the live components of a performance or dynamic art event can never be adequately captured. The intention of many artists is actually to create something that cannot be fixed. Some artists and theorists question and investigate the attempt to create a record of the visual and performing arts.^[21–23] Many artists, companies and institutions are involved in documentation efforts, though. This is done for many reasons: reflecting on the work done; making it available for future reference and inspiration; producing materials that can be used for

publicity and outreach; preserving the artistic and cultural heritage; and more. Video-recording, photography, and many other means are used in documentation efforts; all of them have both advantages and limitations, and there exist a strong debate on why and how to use them in both the traditional and the digital environment.^[24] Many archivists become directly involved in the documentation process, especially, but not only, when they work in in-house archives such as archives of theatres and galleries. Archivists may promote and/or help coordinate the documentation efforts, according to internal policies and existing guidelines, when in place. The people who are part of the visual and performing arts are essential sources, with their minds and bodies, for transmitting and perpetuating knowledge; interviews and oral histories, among other methods, are therefore important to documentation efforts.

Given that the visual and performing arts are dynamic and happen through time, archivists need to be proactive in acquiring existing documentation or in actually promoting the creation of new documentation; this active engagement makes visual and performing arts archivists different from more traditional archivists.^[11]

In order to communicate with artists and to acquire/create documentation in a timely manner, visual and performing arts archivists need to thoroughly understand visual and performing arts practice. As described earlier, the process through which materials are created is very complex and multifaceted, and often as important as the final outcome; materials go through a very complex life. Archivists need to understand this complexity and the reasons why materials were created in the first place. Archivists acquire this knowledge by staying in close contact with practice, and by sometimes taking part in it; many visual and performing arts archivists are actually artists and performers.^[11] An understanding of practice also implies acquiring the technical knowledge necessary to manage the materials. Archivists need to be knowledgeable of the wide range and complexity of formats (audio, video, digital and more), techniques and skills used in the visual and performing arts, in order to correctly manage, preserve, and make available the materials. Given the proliferation of formats and media, and many other considerations, preservation is an extremely difficult endeavor in these fields. Understanding the materials is essential for arranging and describing them, too, especially since existing standards and guidelines generally need to be adjusted and tailored when applied in the fields of visual and performing arts. All of these skills are also necessary when providing service to users and explaining the materials to them. Archivists in these fields are very close to the users, who come from a wide range of areas and have different purposes (p. 14).^[11] Archivists often serve the creators directly, as it happens in in-house archives, and are very active in supporting creativity and promoting use through a variety of activities and initiatives.^[11] Even

more than other types of archives, visual and performing arts archives are there to be actively used, for practical needs, creativity, inspiration, research, and more. In managing visual and performing arts materials, issues of copyright, intellectual property and privacy are crucial. Archivists need to consider artistic and commercial needs, and privacy issues that may arise from managing sensitive and controversial materials, which are very common in the visual and performing arts. Archivists also face ethical issues related to the overall process of documentation and to the nature of the materials. Given the complexity of their work, visual and performing arts archivists need the full support and expertise of their professional communities. Being actively part of professional associations is therefore essential; the next section highlights some relevant associations.

Visual and Performing Arts Professional Associations

Professional associations support the work of those who manage visual and performing arts materials, and also provide useful help to the creators and users of the materials. Professionals are usually part of more than one association. Broad-interest associations include the Society of American Archivists (SAA; <http://www.archivists.org>; accessed: August 12, 2008) and the Association of Canadian Archivists (ACA; <http://www.archivists.ca>; accessed: August 12, 2008). The following are examples of professional associations and groups that specifically focus on issues relevant to visual and performing arts archives:

- The Visual Resources Association (VRA), the international association of image media professionals established in 1982 (<http://www.vraweb.org/>; accessed August 12, 2008).
- The Art Libraries Society UK & Ireland (ARLIS/UK & Ireland) established in 1969, which supports professionals involved in the documentation of the visual arts, including architecture and design (<http://www.arlis.org.uk/>; accessed August 12, 2008).
- The Art Libraries Society of North America (ARLIS/NA), established in 1972 (<http://www.arlisna.org/>; accessed: August 12, 2008), and other affiliated organizations (<http://www.arlisna.org/about/affiliates.html>; accessed August 12, 2008).
- The International Federation of Library Associations and Institutions (IFLA) Art Libraries Section, which is “concerned with all formats of textual and visual documentation for the visual arts”^[25] (<http://www.ifla.org/VII/s30/index.htm>; accessed August 12, 2008).
- The Society of American Archivists’ Visual Materials Section Cataloging and Access Roundtable (VMCAR), established in 1990, which supports archivists and other professionals working with visual materials (<http://www.lib.lsu.edu/SAA/vmcar.html>; and <http://www.lib.lsu.edu/SAA/VMhome.html>; accessed August 12, 2008).
- The International Council of Museums/Conseil international des musées (ICOM), established in 1946, is an international organization of museums and museum professionals, and it maintains formal relations with UNESCO^[26] (<http://icom.museum/>; accessed August 12, 2008).
- The Association of Moving Image Archivists (AMIA), established in 1990, which supports professionals working with moving images (<http://www.amianet.org/>; accessed August 12, 2008).
- The Fédération Internationale des Archives du Film/International Federation of Film Archives/Federación Internacional de Archivos Fílmicos (FIAF), established in 1938, “is a collaborative association of the world’s leading film archives”^[27] (<http://www.fiafnet.org/>; accessed August 12, 2008).
- The Fédération Internationale des Archives de Télévision/International Federation of Television Archives (FIAT/IFTA), established in 1977 (<http://www.fiatifta.org/>; accessed August 12, 2008).
- The Association for Recorded Sound Collections (ARSC), established in 1966, is an international organization that focuses on all aspects of recordings and recorded sound (<http://www.arsc-audio.org/>; accessed August 12, 2008).

CONCLUSION

This entry has provided a brief introduction to visual and performing arts archives, which are extremely dynamic, complex and fascinating for both archivists and users. Materials originate from a multitude of interrelated and often collaborative activities, present a great variety of formats, and are kept in different types of repositories. Since the visual and performing arts are very alive and always experimenting with the new, archivists need to be in close contact with artistic practice, and need to be proactive in their work. Archivists need to always be aware of the big picture, in order to encourage creativity, promote use, and address the ethical and practical issues that arise from archiving and managing visual and performing arts materials. This entry hopes to serve as a useful introduction to those who work in the visual and performing arts, to the archivists who work with visual and performing arts materials, and to the users who are interested in accessing them. The arts are a vital part of life and there are different ways of engaging in them and supporting them; working with visual and performing arts archives is one way to do this.

Visual Resources Association (VRA)

Virginia M.G. Hall

*Center for Educational Resources, The Sheridan Libraries, Johns Hopkins University,
Baltimore, Maryland, U.S.A.*

Abstract

This entry provides an overview of the Visual Resources Association (VRA), an international organization for image media professionals. Beginning with an introduction to the organization and its mission, the entry then provides a history of VRA, including events leading up to its founding in 1982, and gives the background for its importance in the field of information sciences today. Following is an explanation of the organizational structure, a description of the VRA Foundation, and information on the regional chapters, appointments, and standing committees. Two important data standard initiatives, VRA Core and *Cataloging Cultural Objects* (CCO), are described. The entry also provides information on the publications and communications of VRA, the annual conferences, the jointly sponsored (with the Art Libraries Society of North America) Summer Educational Institute for Visual Resources and Image Management (SEI), and VRA's affiliates.

INTRODUCTION

The Visual Resources Association (VRA) is a multidisciplinary organization dedicated to furthering research and education in the field of media management within the educational, cultural heritage, and commercial environments. The Association is committed to providing leadership in the visual resources field, developing and advocating standards, and offering educational tools and opportunities for the benefit of the community at large. VRA implements these goals through publication programs and educational activities. The Association offers a forum for issues of vital concern to the field, including preservation of and access to media documenting visual culture, cataloging and classification standards and practices, integration of technology-based instruction and research, digital humanities, intellectual property policy, visual literacy, and other topics of interest to the field. Through collaboration, partnership, and outreach with the broader information management, educational, and scholarly communities, the Association actively supports the primacy of visual information in documenting and understanding humanity's shared cultural experience.

The international membership includes information specialists; digital image specialists; archivists; art, architecture, film, video, metadata, and digital librarians; museum professionals; architectural firms; galleries; publishers; vendors; rights and reproductions officials; photographers; art historians; artists; scientists; and academic technologists.

Information for this section was culled from a number of Association documents and the VRA website. Many of these sources are anonymously written and reflect an accumulation of information over a period of years by different

writers and editors including known contributors: Kathe Hicks Albrecht, Heather Cleary, Lise Hawkos, Benjamin Kessler, Elisa Lanzi, and Elaine Paul.

VRA HISTORY

From as early as 1968, visual resources curators had been meeting during the annual College Art Association (CAA) conferences. The curatorship of slide and photograph collections required special skills and techniques that were not generally available in established curriculums and could be gained only through experience. For the earliest practitioners in the field, who were often isolated within their respective institutions, this knowledge was hard earned and therefore of great value when they had occasion to meet and share information. During these sessions, curators discussed issues of particular interest to CAA members whose work involved the management of art slide collections. Given the success of these meetings, during the next several years, attempts were made to formalize the relationship of these curators with the larger CAA, yet the group remained essentially an ad hoc committee of visual resources curators for some years.

In 1972, the Art Libraries Society of North America (ARLIS/NA) was founded. Visual resources curators comprised a significant special interest group whose purpose was to provide support and development for those members of ARLIS/NA involved in visual resources management.

By the late 1970s, both regional activity and international activity were under way. Comité International d'Histoire de l'Art (CIHA) recognized the visual resources subgroup as an important part of the international association. Visual

resources sessions were provided during the *CIHA conference* in Bologna in 1979. On the regional level, in 1972, curators began meeting at annual conferences held by the Mid-America College Art Association (MACAA) and in 1976 at the *Southeastern College Art Conference* (SECAC) meetings.

While this range of meeting venues encouraged participation, it also meant that visual resources remained an adjunct to larger concerns and that affiliation along professional lines was episodic and impermanent. An attempt to organize visual resources curators more formally as a subgroup within the CAA in 1973 was rebuffed by that organization's executive board over the technicality that the only level of suborganization allowed by bylaws was that of a committee.

During this time, a number of educational initiatives, including seminars, workshops, and college courses, were developed for slide and photograph collection curators. A short-lived master's program, called "Curatorial Science for Slide Collections and Photographic Archives," was inaugurated in 1969 at the Allen R. Hite Art Institute of the University of Louisville. Sustained largely by the efforts of dedicated individuals in the visual resources field, some of these early initiatives faltered for lack of institutional support.

One particularly dedicated individual was Nancy DeLaurier, Curator of Slides and Photographs at the University of Missouri, Kansas City. Under her leadership, the MACAA visual resources group began to meet independently, creating workshops and sessions on various aspects of visual resources management. In 1976, DeLaurier began conducting a summer workshop offering fundamentals of collection administration for slide curators. The workshop, "Basic Training for Slide Curators," was held in Kansas City from 1976 to 1983. From 1984 to 1997, the summer workshop was continued and expanded at the University of Texas at Austin, primarily led by Nancy Schuller (University of Texas at Austin) and Christine Sundt (University of Oregon).

For the workshops, members developed several kits for the benefit of attending visual resources curators. These kits included information on slide room organization, standards of visual resources management, and other practical aspects of the visual resources profession. These eventually evolved into guides published by MACAA, which, in turn, gave rise to what would later become VRA *Special Bulletins*. This group also began regular publication of the *Slides and Photographs Newsletter*, which for a number of years was the main conduit of information for the visual resources community. The *Slides and Photographs Newsletter* was published under the sponsorship of the CAA from 1972 to 1974 and from 1974 to 1979 under the sponsorship of the MACAA. This newsletter eventually became known as the *International Bulletin for Photographic Documentation of the Visual Arts*. DeLaurier was also responsible for the publication

of the first edition of the *Slide Buyers' Guide* (University of Missouri, Kansas City, 1972).

Parallel to these developments, in 1974, Betty Jo Irvine, then head of the Fine Arts Library at Indiana University, published her monograph *Slide Libraries: A Guide for Academic Institutions and Museums* (Libraries Unlimited for Art Libraries Society). After surveying over one hundred visual resources collections, Irvine presented the first comprehensive, scholarly overview of the field. Irvine treated visual resources as a special, if idiosyncratic, branch of librarianship, and thus governable by general principles of librarianship at large. To this end, she emphasized the value of library education and methodology, in contrast to the extensive subject knowledge and more empirical on-the-job training advocated by DeLaurier, Schuller, and other authorities. Schuller's *Guide for the Management of Visual Resources Collections* was published by the MACAA Visual Resources Committee in 1979.

Visual resources literature in the 1970s addressed a wide variety of topics, including classification, copy photography, slide vendors, equipment, and conservation. However, a round of surveys confirmed that the most pressing issue of the day was professional status, as of then not yet truly conferred by any authoritative body. While both CAA and ARLIS/NA agreed in principle on the need for professional recognition of visual resources curators, the requirement of some measure of library education, favored by ARLIS/NA, proved to be a subject of disagreement within the profession. A sequence of committee deliberations resulted in a statement supporting professional status that, while an important first step, lacked definitive standards.

In 1980, the *Slides and Photographs Newsletter* was renamed the *International Bulletin for Photographic Documentation of the Visual Arts* and soon was independently supported by subscription. With the new decade, it was clear that the profession was ready to form its own organization. Discussions were held, and in 1982 a survey measuring organizational preferences was made of curators in ARLIS/NA, CAA, MACAA, and SECAC. While this survey had inconclusive results, it gave rise to a more pointed referendum that offered four choices: 1) maintain the status quo; 2) make an existing group such as ARLIS/NA or the Special Libraries Association the focus for all national visual resources activities; 3) form an information clearinghouse to coordinate the visual resources activities of other organizations; or 4) form a new and separate visual resources organization.

Although only forty-two people voted, a clear majority favored the creation of a new organization. It was on this basis that the VRA was incorporated as a nonprofit organization in Kansas City, Missouri, in August 1982. From a legal standpoint, VRA was a self-chartered continuation of the CAA committee. Temporary officers were Christine Sundt (chair), Nancy Schuller (vice chair), and Nancy DeLaurier (secretary/treasurer). Bylaws were drawn up

and the first official meeting was held during the annual CAA meeting in Philadelphia in February 1983. Membership was extended to those curators who subscribed to the *International Bulletin for Photographic Documentation of the Visual Arts*. In Philadelphia, officers were elected. They included Christine Sundt, president; Suzanne Babineau-Simenauer, vice president; Helen McGinnis, secretary; Nancy Schuller, treasurer; and Nancy DeLaurier, former president.

The new organization thrived, growing in membership, providing professional support, and continuing to develop a strong publications program. The latter included the publication of a scholarly journal independent of the *International Bulletin for Photographic Documentation of the Visual Arts* entitled *VRA Bulletin*.

The 1990s brought the development and rapid explosion of the Internet and the subsequent expansion of the visual resources field to include managing digital media. During this time it became clear that VRA no longer served just its membership, but played a new and significant role educating the public and contributing research to the broader field of library and information science and instructional technology. The organization led in the effort to develop public understanding of issues on copyright and intellectual property rights, protocols for dissemination of digital materials, standards of cataloging, and the importance of providing a broad public access to cultural information in the digital age.

The organization was invited to send a representative to the Conference on Fair Use (CONFU), which was convened in September of 1994 under the auspices of the United States Patent and Trademark Office and the United States Copyright Office. Attending the conference were representatives from more than sixty different commercial, public, and educational interest groups. CONFU representatives met monthly through 1997 in an attempt to develop fair use guidelines for use of digital and electronic media in image archives, multimedia, interlibrary loan services, electronic reserves, and distance learning initiatives. Despite the fact that the process did not yield workable guidelines, it was an important forum for VRA as it gave the organization recognition on the national scene as a significant contributor on issues of intellectual property rights in the digital age. The VRA was asked to participate in a series of public forums on copyright that were organized by the National Initiative for a Networked Cultural Heritage (NINCH). These Copyright Town Meetings were held in venues across the country between 1997 and 2003 and were open to the public for discussion and debate.

In other developments during the 1990s, VRA annual conferences began attracting a growing number of non-members interested in learning about visual resources; VRA-L, the Association's listserv, became a dynamic resource for members; and the VRA website evolved into an important source of information for students, professionals, freelance photographers, and intellectual property

rights managers in the image media world. Members of the VRA began to educate the larger community on issues such as copyright, image management, technical digital image issues, data standards, cataloging standards, and other emerging issues of importance. At the turn of the millennium, data standards came to the forefront with the Cataloguing Cultural Objects project (CCO) and the introduction of VRA Core. *Cataloging Cultural Objects: A Guide to Describing Cultural Works and Their Images*, published by the American Library Association in 2006, gained national recognition by standardizing the cataloging of visual information, and CCO sponsored workshops, the CCO website, and other outreach efforts began educating a broad audience. VRA Core, based on Dublin Core, grew from a list of elements to describe art and architectural images into a recognized data standard, with an XML schema to promote the sharing of records describing images of cultural heritage materials.

VRA Education Committee began to sponsor conference workshops on important topics of broad interest and offering these workshops and sessions at VRA and other professional conferences. *The Digital Scene*, later called *Image Stuff* and then *Images*, was featured on the VRA website. It was used to disseminate information on collaborative projects, new standards in imaging and metadata, digital preservation issues, consortial projects, training opportunities, and reports from the field. In 2004 VRA, in conjunction with the ARLIS/NA, began offering the Summer Educational Institute for Visual Resources and Image Management (SEI) to provide in-depth educational opportunities to new and seasoned professionals in the field.

Standards for the profession have remained an important consideration. In 1995, ARLIS/NA and VRA adopted *The Criteria for the Hiring and Retention of Visual Resources Professionals*, a set of guidelines for visual resources professionals. This document was revised in 2002 and is currently undergoing a further update. The division within the profession on the desirability of formal library training versus an advanced degree in a content area was resolved by recognizing that different degrees would be applicable to varying situations (academic institutions, research collections, museums, historical societies, archives, public libraries, governmental agencies, and corporations). And, as a variety of media types may be found in a visual resources collection, the electronic management of those materials has become a primary consideration for the profession.

The combined effects of rapid technological change and the financial crisis of 2008 resulted in the elimination of numerous visual resources positions and facilities. VRA convened a White Paper Task Force to respond to these measures, which in 2009 produced the white paper entitled "Advocating for Visual Resources Management in Educational and Cultural Institutions." The paper asserts the continuing importance of visual resources to teaching, learning, and institutional identity. Arguing that

administrative responses to budgetary crises at this time were often shortsighted, the paper identifies six strategic areas for consideration in planning for the future: 1) multiple sources for images; 2) ways of integrating personal and institutional collections; 3) social computing and collaborative projects; 4) the life-cycle continuum of image assets and their description; 5) rights and copyright compliance; and 6) visual literacy.

Several years later, the visual resources profession remains in a state of transition, with many positions' duties attending to image-related tasks beyond curating collections, such as providing instruction in digital imaging and image research, specialization and support in instructional technology, and facilitating various types of digital scholarship. In response to these transformations, VRA charged a Professional Status Task Force with investigating current professional status issues within the field of image and media management. A final report was submitted in June 2016.

Since 1988 the VRA has honored an individual who has made an outstanding career contribution to the field of visual resources and image management with an annual Distinguished Service Award. Nominees must have achieved a level of distinction in the field either through leadership, research, or service to the profession. The Nancy DeLaurier Award, named for one of the pioneers of the visual resources profession, annually honors a visual resources professional for distinguished achievement in the field. Originally conceived in 1997 as a writing award, to be presented in recognition of a published paper, the Nancy DeLaurier Award now recognizes other forms of achievement in the field, as measured by immediate impact, and may take the form of published work, oral presentation, project management, software development, technology application, website creation, or other outstanding effort.

Today VRA is a firmly established international association with hundreds of active members. The association provides its members wide-ranging benefits. VRA is now a leader in developing public awareness on copyright and intellectual property rights, establishing protocols for the dissemination of digital materials, recommending cataloging standards, and promoting broad public access to cultural information in the digital age.

ORGANIZATIONAL STRUCTURE

VRA is governed by an executive board comprised of five regular officers serving two year terms plus an officer who serves one year as president-elect and then two years as president. The other officers are the secretary, treasurer, vice president for conference arrangements, vice president for conference program, and the public relations and communications officer. The former president serves 1 year in a non-board advisory capacity. Officers are nominated by a committee and elected in balloting by eligible VRA

members. The board makes appointments, oversees standing committees and task forces, and approves the organization of regional chapters.

VRA FOUNDATION

In 2004 a task force was appointed by the VRA board to investigate the tax status situation of VRA and to make recommendations. The VRA was incorporated in 1982 as a 501(c) 6 organization, a trade association. Although a trade association is nonprofit, it is an organization established solely to provide direct services to its members. VRA is a fine example of a well-functioning and significant 501(c) 6 organization. As it has grown, the Association's importance has come to extend beyond its member services. Yet, due to the U.S. Internal Revenue Service tax status limitations, VRA, as a 501(c) 6 trade association, has not been able to pursue major grants to engage in research or other educational endeavors.

The Association's educational and research components are now important assets and major resources for the general public and the field of information management. After a year of studying the issues, the task force recommended that from an organizational standpoint, a separate 501(c) 3 VRA Foundation offered a way to most efficiently oversee and extend these significant and influential educational and research efforts.

In July 2007, the VRA Foundation was incorporated in the state of Delaware, and in September 2007 the Internal Revenue Service granted the Foundation 501(c) 3 tax status. The purpose of the VRA Foundation is to develop and expand educational and research opportunities in the public interest; establish standards for emerging electronic media; manage grants and develop programs to improve the visual resources field; conduct and/or sponsor research in the information sciences and educational technology; publish informative articles, guidelines, and online resources; and complement the work of VRA by providing educational, literary, and scientific outreach to the larger community and general public. Through the VRA Foundation, VRA furthers its significant and growing educational and research efforts. Accordingly, the VRA Foundation has assumed responsibility for the Summer Educational Institute and Cataloguing Cultural Objects.

The VRA Foundation board is comprised of seven directors serving two-year terms. Four of the directors are appointed by the VRA board, and three by the Foundation board. Three officers—a chair, treasurer, and secretary—are selected by the directors from their ranks.

REGIONAL CHAPTERS

VRA has fourteen active regional chapters. The Chapter program was developed to extend VRA outreach and

professional support to the local level. Attending chapter meetings provides opportunities to make professional contacts, share knowledge and expertise with colleagues, and benefit from continuing education events. The following regions are represented: Canada, Great Lakes, Greater New York, Mid-Atlantic, Midwest, New England, Northern California, Pacific Rim, Southeast, Southern California, Texas, Upstate New York, the Wild West (Mountains and Plains states), and an International Chapter with members from various countries across the globe.

APPOINTMENTS

The VRA board appoints both individuals and task forces to undertake short- or long-term projects, investigations, initiatives, or service. Current appointees include the editors of Association publications and website, a Communications Technology Advisor, a Social Networking Contributor, a VRA Archivist, a representative to the Picture Licensing Universal System Coalition (PLUS) Board of Directors, Affiliate Representatives who liaise with VRA's affiliated organizations, and several working task forces. Appointed independent contractor positions include a membership services coordinator, an accountant, and a bookkeeper.

STANDING COMMITTEES

VRA maintains a number of standing committees to work on Association projects, initiatives, and outreach. Standing committees include Awards, Data Standards, Development, Education, Financial Advisory, Intellectual Property Rights, Membership, Nominating, Travel Awards, and VRA Core Oversight.

PUBLICATIONS AND COMMUNICATIONS

The VRA Bulletin

The *VRA Bulletin* is published twice a year by the Association. A journal of professional practice and the flagship publication of the Association, it features articles on important professional issues ranging from cataloging, copy photography procedures, image and data standards, and collection management and administration. Also included in the *VRA Bulletin* are reviews of recent publications, and updates on commercial image sources.

VRAweb.org

The VRA website, located at the URL <http://www.vraweb.org>, has both public- and members-only sections. The home page features a dynamic News section that provides current updates on Association activities and events. Other

sections of the publicly accessible site contain the VRA Constitution and Bylaws; Association history and mission; listings of current executive board members, appointees, chapters, and committees; information about VRA affiliates, past and future conferences, membership benefits, the awards program, employment opportunities, the Mentor Program, and special interest groups; as well as links to numerous VRA documents and initiatives.

The members-only section of the site includes the member directory, as well as business meeting minutes, annual reports, financial statements, strategic plans, outreach materials, and forms and documents used for leadership and management purposes.

VRA Listserv

The VRA Listserv, VRA-L, is intended to expedite communication among VRA members on important issues related to the Association, to visual resource curatorship, to related technologies, and to the profession. Appropriate postings forwarded from VRA nonmembers are welcome. Subscription to VRA-L is restricted to VRA members or paid subscribers to VRA-L. VRA-L was started in 1991 and has been an active Listserv serving as a vital communication tool for its members.

Social Media

VRA's appointed Social Networking Contributor coordinates VRA's communications via social media. Current accounts include Facebook, LinkedIn, and Twitter.

Special Bulletins

The *Special Bulletins* are occasional publications, each on a different, specific subject. While *Special Bulletins* are no longer being published in favor of disseminating content in the *VRA Bulletin* and on the VRA website, many of the *Special Bulletins* are still in print and available through the Association. Selected titles are also available for downloading as electronic documents. The publications include guides to cataloging Asian and Chinese Art, subject classifications for image collections, standards for photograph and slide conservation, a guide to copy photography, disaster planning for visual resources collections, a description of iconographic contents and diagrams for cataloging complex works of art, and, most recently, strategies for transition to the use of digital media.

DATA STANDARDS

Cataloging Cultural Objects (CCO)

Cataloging Cultural Objects: A Guide to Describing Cultural Works and Their Images (CCO) is a data content

standard for the description of art and cultural objects and their visual surrogates, sponsored by VRA, and published in 2006 by the American Library Association (ALA). CCO was developed by the VRA to provide guidance to visual resources curators, museum documentation specialists, librarians, archivists, and others engaged in describing works of art and architecture, objects of material culture, and their images. Oversight of CCO has been assumed by the VRA Foundation.

VRA Core Categories

Since the 1980s, VRA has worked on creating standards to describe images. As every visual resources collection uses different and variant standards, the Association has worked toward creating a usable and common standard. VRA Core 4.0 is a data standard for the cultural heritage community that was developed by the VRA's Data Standards Committee. It consists of a metadata element set (units of information such as title, location, date) as well as an initial blueprint for how those elements can be hierarchically structured. The element set provides a categorical organization for the description of works of visual culture as well as the images that document them.

The Metadata Encoding and Transmission Standard (METS) Editorial Board officially endorsed VRA Core 4.0 schemas (release version April 9, 2007). This endorsement confirms VRA Core 4.0 schemas (both restricted and unrestricted) are in line with nationally recognized metadata standards and will work well as an extension schema for any METS objects that contain images of cultural heritage resources.

Based on the Dublin Core model, VRA Core has grown from a list of elements to describe art and architectural images to a data standard, with an XML schema to promote the sharing of records, for describing images of cultural heritage.

Five versions of VRA Core have been released:

1. VRA Core 1.0—published in 1996
2. VRA Core 2.0—published in 1998
3. VRA Core 3.0—published in 2002
4. VRA Core 4.0 beta—published in 2005
5. VRA Core 4.0—published in 2007

ANNUAL CONFERENCE

VRA conducts an annual conference, held in a different city each year. This event provides workshops, sessions, and seminars on issues of interest, a chance to meet colleagues both formally and informally, and the opportunity to view current commercial products. VRA members and nonmembers alike attend the VRA annual conferences to learn about the profession and network with colleagues in the field.

SUMMER EDUCATIONAL INSTITUTE FOR VISUAL RESOURCES AND IMAGE MANAGEMENT

The SEI began as a joint VRA and ARLIS/NA project in 2004. Now administered for VRA by the VRA Foundation (VRAF), the Institute provides a standardized and sustainable program for training in image collection management, with a focus on issues related to the transition from analog to digital collections. SEI is held in diverse geographical locations in order to encourage broad participation by professionals seeking standardized training.

Professionals in the field of visual resources currently have to master several different sets of knowledge/expertise to successfully administer existing resources, preserve unique collections within those resources, and engage in the process of converting analog resources to digital modes of presentation. In addition, they have to be conversant with national and international standards, organizations, metadata initiatives, and online resources. As most library and information science programs do not address the needs of image collection professionals, the jointly sponsored ARLIS/NA–VRA Summer Educational Institute is intended to provide a standardized and sustainable program for visual resources training, with a focus on issues related to the transition from analog to digital collections.

As an ongoing endeavor, SEI changes in focus and emphasis each year to meet the needs of new professionals and of institutions facing the demanding metamorphosis from analog slide collections into digital image resources.

SEI is open to professionals, paraprofessionals, and graduate level students in visual resources, library science, the fine arts, related humanities fields, and other image information disciplines. Anyone with a need to learn about managing image collections is encouraged to participate. SEI is designed to serve various levels of expertise including individuals new to the profession, librarians or other information professionals with new responsibilities to oversee and manage image collections, and visual resources managers and art librarians who wish to update their knowledge of current practices.

AFFILIATES

VRA seeks mutually beneficial affiliations in support of its mission, with the goal of facilitating steady communications, collaborative opportunities, and participation in the events and activities of like-minded organizations. Current VRA affiliates are the Art Libraries Society of North America (ARLIS/NA), the College Art Association (CAA), the Society of Architectural Historians (SAH), and the *Southeastern College Art Conference* (SECAC). Other like-minded organizations are listed on VRA's website.

CONCLUSION

The VRA, an international organization, has an active membership of professionals in the image management field from educational, cultural heritage, and commercial environments. The Association was formed in 1983 by slide and photograph curators from institutions of higher learning and museums who supported the teaching and research of art and architectural and art historians. It has

grown to include a wide range of specialists supporting image collections and other image- and media-related endeavors. Educational and informational outreach is provided through annual conferences, the SEI, the *VRA Bulletin*, and the VRA website. VRA has been a leader in educating the larger community on copyright and fair use issues, image management, digital image technology, data standards, and cataloging standards.

Visual Resources Management in Cultural Institutions

Jacqueline Allen

Dallas Museum of Art, Dallas, Texas, U.S.A.

Marcia K. Stein

Museum of Fine Arts, Houston, Houston, Texas, U.S.A.

Abstract

Visual resources collections play a vital, yet virtually invisible, role in the life of a museum. They exist to support the mission of their institution through dissemination of the accurate reproduction of works in the collection as well as being the central repository for images acquired for publications and exhibitions. This entry will primarily discuss the history, collections, organization, and professional protocols of art museum visual resources collections in the United States, realizing that the scope of collections and activities of those entrusted with them can be generalized to any cultural institution's needs. It seeks to highlight how collections are built from various sources and the skills and knowledge a manager of those collections must possess to effectively carry out their duties. An extensive recommended reading list is included to point the reader to standard literature for a deeper understanding of important aspects of managing visual collections. An emphasis is placed on understanding issues with digital image formats, rather than film, since most collections are shifting workflows and staffing to accommodate digital formats. Issues surrounding the preservation and dispersal of film-based collections will also be addressed.

INTRODUCTION

Museums are institutions that collect, preserve, and interpret all manner of things, from masterpieces of art to the most common of utilitarian objects (<http://icom.museum/the-vision/museum-definition/>). By creating and maintaining the visual record of museum objects and events, visual resources collections play a vital, yet virtually invisible, role in the life of a museum. Visual resources collections may contain any of a number of different types of photographic formats from glass-plate negatives to high-resolution, direct-capture digital images, all with the purpose of documenting the history of the cultural institution, the objects in the collection, the way in which they are exhibited, and the role of the object in history. This entry will primarily discuss the history, collections, organization, and professional protocols of art museum visual resources collections in the United States, realizing that the scope of collections and activities of those entrusted with them can be generalized to any cultural institution's needs. This is due to the authors' affiliation and the wide range of documentation relating to art museum collections; however, collection stewardship guidelines and issues surrounding management of digital collections can be applied to visual resources collections within any cultural institution.

Various names are assigned to the department that acquires, organizes, and distributes images. Traditionally, it had been called the visual resources library—a name that reflects the content—a library of images used for publications, programs, and teaching. With the introduction of digital formats came a natural progression of new

responsibilities based on the ease of reproducibility and repurposing of images in-house, followed by a name more descriptive of the function rather than the content. Several art museum collections have changed department names to reflect broader imaging functions. In 2002, the department of Photographic Services, once a separate department at the Museum of Fine Arts, Houston, was moved to the Image Library and renamed the Photographic and Imaging Services Department when it was recognized that the functions of both departments were intertwined. The Dallas Museum of Art's visual resources library was renamed Imaging Services, has also included the photographers and rights management since 2002, and in 2014 moved all non-object photography to the institutional archives, with imaging staff reporting to information technology (IT) and digital media. Other museums have formed departments based on the digital format such as the Brooklyn Museum of Art's department, Digital Collections and Services, formed in 2005 that includes the photo studio, scan lab, rights-related activities, and digital asset management. For this entry, we will refer to the activities of acquiring, organizing, and distributing images, as visual resources management.

HISTORIC CONTEXT

The reproduction of works of art by artists, collectors, and, later, museums is well documented in the history of art. Painted copies and drawings after original works created a precedent for later mechanical reproductions, such as printed copies that could be made in great numbers, not

only to grace the walls of humbler owners but also to disseminate information about new and important objects. The photographic reproduction of art objects was a natural result, and museums were quick to embrace the new medium as early as the 1850s. The history of visual resources collections in museums dates back almost to the beginning of photography itself. Museums hired photographers to document their objects and events to promote not only scholarship but also the museums themselves. Museums have always taken advantage of the newest photographic formats available, moving from glass negatives and salt prints in the mid-nineteenth century to film and now to digital. For the majority of the twentieth century, museum visual resources collections housed extensive libraries of black-and-white negatives and prints, color transparencies in various sizes (120 mm, 4 × 5 in., 8 × 10 in., with 4 × 5's being the standard), and 35 mm color slides. With the introduction of direct digital capture, the standard format of the early twenty-first century has moved to high-resolution digital images captured on high-end DSLR cameras and professional digital camera systems. A chronology of the "slide library" can be found online at http://en.wikipedia.org/wiki/Slide_library.

Although the professional standards for visual resources managers are the same for collections in universities and museums, the roles played by the collections are much different. This is evident especially in the way that the museum visual resources collection supports traditional noneducational activities. Visual resources collections in universities exist primarily to support the teaching curriculum of the university or department. Museum visual resources collections often function in this way, but it is just one of the many functions of the department. A major role of many visual resources collections is to promote the museum and its collections through the dissemination of high-quality reproduction images. In the case of art museum collections, the responsibility of providing high-quality images is extremely important since a poor reproduction of a great painting could be seen as a reflection on the quality of the art collection itself.

BUILDING COLLECTIONS

The content of visual resources collections varies according to the needs of the institution and constituency that they serve. Some purely consist of photography relating directly to the objects in their own collection. Others include noncollection materials that provide historical or subject context in which the museum's objects can be understood. The collections may either be available for public use or have access restrictions limiting patronage to staff and/or volunteers. For example, the American Museum of Natural History's Photographic Collection in New York City dates back to the Museum's beginnings.

Albert Bickmore, founder of the Museum, who became superintendent of public education, gave lantern slide lectures to school teachers. A lantern slide lending library was formed under the auspices of the department of public education. Meanwhile, Museum scientists were traveling the globe and returning with negatives. Prints were often pasted into scrapbooks in the science departments; and the negatives and scrapbooks were later deposited in the Museum's education department. The Museum Library's Special Collections is now in charge of virtually all of the negatives in the institution, and most of the prints, as well as many of the historic lantern slides. The collection as it is known today is supervised by the museum archivist and head of Library Special Collections.

The origin of the content, whether physical film or digital image, will depend on whether the image originates with the institution or if it is documenting an exterior event or object, in which case a third-party provider will need to be consulted for terms of use. For institutional images and event or program documentation, the institution may have staff photographers or photographers that are hired for a specific project. Many museums require that non-staff photographers sign "work for hire" contracts that relinquish the copyright of their photography to the museum, thereby granting full ownership of the photography to the museum. Consultation with museum counsel is necessary when contracts such as these are drafted. Cataloging and stewardship of those images may reside with staff in the visual resources library or be the responsibility of another department, such as the archives. There are instances where photography is created for a specified purpose. Images that document a work's condition or complex installation procedure could be created by the museum's photographer or a conservator, but may not be housed in the visual resources library due to confidentiality. Those images may be linked directly to object documentation, but access would be limited to specific staff.

Other Content Sources

Reference images, those images whose content is owned by a third party, can come from a variety of sources. Reference images might be used for study purposes by staff, illustrations for a lecture, reproductions in an exhibition catalogue, or didactic materials in an exhibition. Ideally, the images would be obtained from the source that created the image; however, that is not always practical, or necessary. Third-party providers can fill most needs for teaching images and related uses, but not all. Those images will be subscribed to or purchased for educational use and will have use restrictions. In some cases, for example, with ARTstor, museums are both contributors and subscribers to third-party content. ARTstor is a subscription service that provides remote access to a growing database of images for teaching (<http://www.artstor.org/>). While not generally needed for educational use, at times,

visual resources managers may need to license images from stock photo collections such as Getty Images or Art Resource. Frequently, images for teaching are scanned from previously published sources in the tradition of copy-photography. This content source should only be utilized within the parameters of copyright laws in the region, such as Fair Use in the United States. Several organizations have published Fair Use Statements in recent years and they are listed in the “Visual Resources Management Resources” section.

An Ever-Changing Landscape

Storage issues have always been a major concern for visual resources managers. In the past, physical storage of photographic negatives and positives has posed interesting and sometimes dangerous problems. Some materials require cold storage (color positives), while others do best in dark, dry, temperature-neutral environments (black-and-white negatives). In an extreme case, nitrate negative films must be housed in secure, cold, pressurized containers to prevent explosive reactions with air. The common thread for these types of materials, however, is the need for physical space for storage. Storage rooms and sometimes even whole floors are necessary to provide the physical storage space for photographic materials. Visual resources managers must also be knowledgeable in the conservation requirements for each type of material in their collection and make suitable arrangements for the storage and housing of each type of material.

Digital storage may not require the physical space of earlier materials, but it is no less important for the viability of any visual resources collection. The actual footprint of storage space can be reduced drastically if the digital files are stored entirely on local or cloud-based servers. The decision to keep all files on servers requires that server technology is kept up to date, and data migration policies are implemented. As technology changes and new digital file formats are developed, migration policies must be in place to ensure that files created today will be able to be accessed in the future. The information contained in a digital image file is dependent on the format chosen. File formats become obsolete as newer formats are developed, so institutions have to make a commitment to migrate data files to current formats. The use of compressed file formats or proprietary formats is discouraged. Compressed files, most notably “lossy”-type formats, cannot be depended upon for future accuracy of information. Proprietary formats are often the first types of files to become obsolete and therefore very difficult to access in the future. Digital files may also be stored off-line on media such as magnetic tape, optical drives, and CD/DVD media. This method is not recommended and the choice to save files on such media presents its own preservation issues that involve the obsolescence of the physical media as well as the computer hardware to access it. The visual resources

manager must weigh the benefits of storing files off-line, which may be less expensive in the short term in terms of network storage costs, against the costs of physical storage space for the media and the staff time and expense of migrating both media and file data. Off-line storage also makes retrieval and distribution difficult.

Working in conjunction with institutional IT staff, visual resources managers must plan for scalable solutions that will protect the digital collections they have toiled to create. In managing collection documentation, especially of art objects, image file sizes can become huge and inefficient to store in-house. Cloud-based storage services are being used for management of large collections and can be useful if a reliable and secure service is selected. The choice to outsource file storage can eliminate the need to increase back-up storage solutions to meet demands for preservation and retrieval if a server fails in-house.

The downside of having virtual assets rather than physical ones, however, is that access and retrieval are now totally dependent on computer searches, making proper and often complex cataloging systems necessary. In the past, many museums did not see the need to undertake extensive cataloging initiatives for their film-based visual resources collections, relying instead on a physical filing system for retrieval. Larger museums, with larger collections of images such as Harvard University’s Fogg Museum of Art, invested in cataloging systems and became the prototype for others. With the advent of digital collections, even the smallest museum is now having to deal with retrieval issues making database and system decisions important. While some museums have chosen to create their own databases in software applications such as FileMakerPro or Microsoft Access, it is recommended that visual resources collections employ specialized digital asset management systems (DAMS), which combine sophisticated cataloging data with retrieval and distribution functionality. DAMS that also include elements of digital rights management are preferred, but are currently difficult to obtain and require much customization.

Best Practices

The digital revolution has affected every aspect of our daily and professional lives. To that end, sustainability is a concern for many and research is ongoing at universities and coalitions of organizations to create best practices for those working in the field. Through the advice of these organizations, the field of visual resources management is becoming more standardized, and museums are embracing the idea that sustainable image collections are important in intellectual and fiscal terms. By following the basic guidelines outlined by these best practices, museums have a means of creating and caring for collections that will provide rich resources for scholars and museumgoers now and in the future.

Issues have come to pass with the establishment of digital imaging that visual resources collections did not have to deal with previously. When photographic collections were film-based, many visual resources collections had limited technology concerns beyond transparency viewing. For some institutions, common office supplies and furniture sufficed for the care of collections, while others employed state-of-the-art conservation supplies for housing materials, the choice of which was often based on funding and how each museum administrator viewed the importance of the collection. Typewriters and, later, word processors and computers were used to create labels for the materials. With the advent of digital collections, however, the visual resources collection may be the department with the most sophisticated computer equipment in the entire museum.

With digital formats come a new set of variables to manage when providing images for users. Current equipment and software are as important for efficient processing of requests as is knowledgeable staff. Visual resources managers work in a fast-paced environment where requestors expect to be able to access images without delay. There is a perception that digital image creation is faster than traditional photography. While that is not completely true, managers who can integrate the processes of image capture (whether directly from the object or scanned from existing photography), image manipulation, cataloging, and reliable delivery systems will encounter the least number of problems when delivering a requested set of images. Settling on standard image formats and consistent workflows ensures delivery of high-quality images.

Color management is one of the most important aspects of digital quality control and must be integrated into all visual resources activities. It involves a wide range of processes including matching digital images to displays and prints, calibrating printers, and using color management tools. At the very least, digital systems require a basic knowledge of how to synchronize monitors throughout the lab to ensure a consistent image output for users. Art museums spend a great amount of time working with printing presses to ensure color fidelity for images of their objects. The Universal Photographic Digital Imaging Guidelines, which promotes color sustainability from the viewpoint of the museum photographer, is one such resource for best practices (<http://www.updig.org/index.html>).

The use of digital systems requires that visual resources staff maintain a close working relationship with IT staff. In a film-based collection, interaction with the IT department was only necessary to provide support for word-processing programs, database application issues, or e-mail problems. Now, the department head must communicate a variety of requirements such as the need for and issues about image manipulation software, color management tools, servers to store images, fast connections to the

server to transfer images, and outsourced storage for large files, just to name a few.

Although collections may be acquiring images and filling requests in strictly digital formats, issues surrounding film storage and production continue to be relevant to the visual resources manager. As long as collections house or produce film or prints, best practices for processing, duplication, and especially storage must be maintained. For example, the Library of Congress includes collection care guidelines on their website <http://www.loc.gov/preservation/care/photo.html>.

Visual resources managers are routinely entrusted with digital conversion projects. This is where knowledge of film formats and capabilities of those formats are invaluable. Whether converted on a case-by-case basis or en masse, unique collections are being converted to digital formats for ease of distribution or presentation online. For example, when cultural institutions work with partners on a project, as in the case of a catalog related to a traveling exhibition, one partner might only have images on film for an object. In order for these images to be distributed to the publisher, the film has to be converted to a standard digital format.

Archival Images

If an institutional archive has not been established in a cultural institution, then master images taken of events, exhibition installations, and personnel are most effectively managed by centralizing them in the visual resources collection. Exhibition installation images are critical to documenting one of the most important activities of the museum and are requested frequently for publication, especially for reproduction within an artist monograph. Acquisitions for the permanent collection and the display or exhibition of those and other works is a primary activity for cultural institutions, and one for which a careful record must be maintained. For any event that takes place at a museum, there is the possibility that a photographic record will be created. Program documentation includes photography of speakers at a lecture, dance performers, school groups, family activities, or exhibition openings. Additions or changes to the public spaces, building exterior, object storage, or landscape are important historic records and are of interest as documents showing changes that have taken place over time. If staff portraits are taken and archived, the visual resources collection may be the repository for these images.

The nature of documentation images makes them a prime candidate for transfer from film formats to digital. Digitization allows for effective distribution (of copies) and preservation (of the original) because the documented event, now passed, is not available to reshoot with direct digital capture. The library at the American Museum of Natural History is systematically scanning its rare book illustrations as well as extensive documentary image

collections estimated to contain over 1 million images between negative, print, large format transparency, lantern slide, and 35 mm slide collections. After completing a pilot project for digitization and online access, Picturing the Museum: Education and Exhibition at the American Museum of Natural History (<http://images.library.amnh.org/photos>), the AMNH Research Library established Digital Special Collections (<http://lbry-web-007.amnh.org/digital/>), supervised by the museum archivist and carried out by the visual resources librarian with assistance from project managers, lab managers, and volunteers. In addition to building collections, the new visual resources team also works with museum departments and researchers to provide data and images for special events, exhibition needs, and publications. Through conversion to digital formats, the vast photographic collections at the AMNH Library can be accessed by researchers and the public for a fascinating glimpse into the past.

Object photography occasionally requires updates due to changes in the physical state of an object, changing tastes in three-dimensional object backgrounds, or the need for an image taken from a different angle. Previous versions of object photography might be retained for documentation of an object's condition over time.

To simplify the discussion of archival documentation, only photographic images were addressed here in detail; however, the ability to create audio and video documentation of the subjects noted is becoming commonplace and carries its own set of issues for storage and distribution. Since these files are also moving to direct digital capture, visual resources managers have needs in common with creators of that content and might even collaborate on finding solutions for the institution.

COLLECTION ACCESS

User Services

Visual resources staff need to be effective teachers. They have to communicate instructions on many levels that range with the patron's familiarity of the image collections. Staff new to the museum will need to be trained in the scope of the content and services as well as basic methods for making requests. When film was the primary delivery format, the choices were limited, and requests could be filled by sending film to a professional photography laboratory that employed standard formats for development or duplication. With digital images, and the variety of possible end-user formats, an initial in-person interview setting is generally the most efficient way to arrive at the final format necessary to fill a request.

Imaging staff become well versed in the activities of the institution as a whole while filling image requests. Making formats available, appropriate to the end use, is important to being able to fill the requestor's needs. Staff involved in

museum activities other than curatorial and education will primarily need access to digital images from one of three categories: the permanent collection, recent events, or upcoming exhibitions. The staff who are in charge of interpreting and exhibiting the collection will require a wholly other set of images to study, teach about, and interpret objects in their care. The ability to effectively communicate with scholars on a full range of topics is a unique and valued quality of the museum visual resources professional.

There are several levels of collection sharing that either originate with or are facilitated by staff in imaging. The most basic level of service is filling requests for in-house uses that can either be for a program taking place at the institution, a staff person who is asked to speak on the collection elsewhere, or via printed materials that are produced about exhibitions or programs. A fast-growing resource for learning about all aspects of a cultural institution is their website where users expect to see images of the collection, details about upcoming programs, and a variety of educational materials. The visual resources staff is central to this primary communication vehicle since many images that appear online are delivered directly or indirectly through the visual resources department.

Virtual Organization

In digital collections where a DAMS has not been implemented, images may be organized in a variety of ways and may or may not be available for browsing, and staff intervention is frequently necessary if the correct images are to be found. Object collection photography is filed or stored on a server according to the object's accession number or some close variation of that. Events are generally described according to the department of origin and the date the event took place. Exhibition images are generally organized by the exhibition title and selected by the organizers to represent the overall theme. They are used in print or website advertising, on invitations, or as illustrations for articles and reviews in newspapers or journals.

Images that originate on film are converted to a digital format before printing. In many cases, scanned images are produced in-house, and central scanning services have been integrated into the workflow of the imaging department. The more that staff in visual resources know about digital formats for printing and online use, the more relevant the department will be to filling institutional needs now and in the future. When preparing a digital image for any request, the most important question to ask is, "How will the image be used?" The ability to deliver correct formats for an end use is a critical function of visual resources.

Collection Preservation and Dispersal

Images produced by direct digital capture, and permanent retention of the resulting digital files, have resulted in

many print and film-based collections being disposed of, downsized, or ceased and physically moved to special collections or archives departments. When this is the case, staff find that the format of the image drives departmental priorities to shift and emphasize management of and access to the digital files using multiple computer systems. In cases where the image format has dictated reporting structure, organizations are actively seeking staff skilled in technology applications and well-developed metadata management and database skills. Deep subject knowledge is required as an educational foundation, but technical expertise and experience has become a deciding factor for many new hires. Distribution of digital content relies heavily on consistent metadata application and efficient workflow management. This transition of focus has been prompted in many cases by an increased emphasis on online access, with image collections as a central audience draw.

Dispersal of collections has prompted much discussion among professionals, and in 2014 the Visual Resources Association's Slide and Transitional Media Task Force published *Guidelines for the Evaluation, Retention, and Deaccessioning of 35 mm Slide Collections in Educational and Cultural Institutions*. Emphasis is placed on retaining unique collections, which in some cases results in simply downsizing teaching collections to retain only one copy of an image, or transferring documentation image management to institutional archives collections.

At the Dallas Museum of Art, an administrative reorganization led to legacy image collections in several formats being physically moved to the department of archives. Images included exhibition and permanent collection gallery installations, events, building and construction documentation, and portraits or informal images of people. Formats included black and white prints, color prints, 35 mm slides, 35 mm negatives, 4×5 negatives, 4×5 transparencies, and images on optical disk (if digital files were removed from the media and cataloged in the digital asset management system, the disks were discarded). In terms of organization, for ease of access and reference purposes, the transferred prints, negatives, slides, and disks were added to existing collections of permanent print photography and each collection was simultaneously reprocessed. In this case, slides have been removed from cabinets and sleeved during reprocessing, though one could choose to process slides as a separate series and store them in boxes or drawers. The analog photography collection at the Dallas Museum of Art is considered closed since the museum is no longer producing print or film-based image records.

Cataloging and Standards

Images need descriptive cataloging for intellectual control and to create paths for access to images for a particular use. Terms need to be assigned consistently and stored

relative to the image or with a path to the location of an image. To facilitate image sharing, standards for data fields, such as Categories for the Description of Works of Art, and content creation, such as Cataloging Cultural Objects, were introduced that are now becoming sophisticated and essential to managing digital collections. Without good cataloging, standard image naming, and reliable storage systems, a growing digital collection can become useless in a very short amount of time. See "Visual Resources Management Resources" for relevant cataloging content and data standards. For examples of online museum image collections, see the British Museum <http://www.britishmuseum.org/>, or the Metropolitan Museum of Art <http://www.metmuseum.org/>.

Digital Asset Management Systems and Digital Rights Management Systems

Content management systems (CMS), including DAMS, are integrated computer systems used to manage, distribute, and store digital files. The term DAMS most often refers to such systems that manage only nontextual files such as image, video, audio, and gaming-related formats. DAMS allow for the ingestion of master files and accompanying metadata, the ability to search for specific files meeting specific search criteria, the creation of derivative files from the master for a variety of uses, the storage of the master files, and in some cases active file preservation and migration platforms.

Digital rights management systems (DRMS) are systems designed to manage the usage rights for digital files. While many CMS and DAMS include some digital rights management services, the two types of systems are not identical, and care must be taken by visual resources management professionals to ensure which institutional solutions are chosen that balance the need for access against the intellectual property rights afforded to the creators of digital materials.

The need for sophisticated computer systems to manage digital assets and digital rights arrives at different times at different institutions. In some institutions, DAMS and DRMS implementations are part of a larger institution-wide initiative to gain control of digital assets ranging from text documents to video footage. At others, the decision to implement these systems happen at a departmental level, focusing on only one type of digital asset, such as still photographic images. Implementation of DAMS often occurs when the number of redundant files becomes so confusing on shared network servers that questions arise concerning authoritative data and file accuracy.

Data linkage between a museum's collection management system and its DAMS should exist for images of works from a museum's collection to promote consistency across museum departments when releasing information to the public. The combination of data found in the

collection management system with the descriptive cataloging data often employed in the visual resources collection provides a very sound basis for searching collection objects by patrons from the most dedicated university scholar to the occasional museum visitor.

Rights and Reproductions

A function that might be assumed by the visual resources collection in a museum is the acquisition and granting of reproduction rights, especially when the visual resources department houses the photography or images in question. Museums are often asked by outside parties for permission to reproduce images of objects from their collection. Some museums see this function as a revenue-generating activity and set monetary goals that the department must meet. Others see this function as a way to expand knowledge about the museums' collections, so they take a less profit-driven approach. A growing number of museums have separated commercial from scholarly requests and have begun to grant free access to images for scholarly publications through services such as ARTstor's Images for Academic Publishing (<http://www.artstor.org/content/collaborations>) or added features to their own site, such as the Open Access for Scholarly Content option at the Metropolitan Museum of Art. Most museums continue to charge reproduction and/or image usage fees for nonscholarly or commercial reproduction requests.

Copyright

Staff members that work with or are in the position to distribute visual collections to users and potential publishers need to be aware of intellectual property law and guidelines. This is essential in any collection where unique intellectual content is being recorded and distributed. In the United States, an understanding of the Fair Use Doctrine of U.S. Copyright Law is also a necessity since misunderstandings of this doctrine are rampant at nonprofit institutions. A common statement heard in visual resources collections is, "My use is educational; therefore my use falls under Fair Use." Use must meet certain requirements to be seen as Fair Use, so it is incumbent on visual resources professionals to fully understand the parameters of laws in the region in which they work. In the United States, see <http://www.copyright.gov/fls/fl102.html>.

Museums, like most libraries and archives, are in the position of owning objects for which they do not own the copyrights. In order to publish catalogs, produce retail objects, and even post images of art objects on their own institution's websites, museums must often negotiate with individual rights holders or clearing houses. American visual artists might choose to outsource requests for reproduction of their work to clearing houses such as Artists Rights Society (ARS) (<http://www.arsny.com/>) or Visual

Artists and Galleries Association (<http://vagarights.com/>), which are based in the United States. A list of organizations outside the United States is summarized on the ARS website.

VISUAL RESOURCES STAFF

Visual resources professionals from both museums and universities began meeting at academic conferences in the 1960s to discuss common issues and solutions to caring for art history slide collections. Since that time, the profession has evolved to include members from a wide variety of institutions that care for images in all formats on a variety of topics. Organizations such as the Art Libraries Society of North America and the Visual Resources Association have developed and advocated professional competencies for members of the field, and these have become more widely adopted by museums over the past decade.

Levels of staffing will vary with the type of activities performed. Depending on how many image functions have been centralized in an institution, the size of the staff can vary. For example, in an art museum, there might be a department head, a cataloger, a database specialist, a rights and reproductions manager, an administrative assistant, and/or photographers.

In terms of organizational structure, visual resources collections are administratively aligned with a wide variety of areas including the museum library, archives and special collections, registrar, education, collections and curatorial, IT, and academic deans in the case of collections affiliated with a university. Visual resources management has been performed by both professional and volunteer staff, depending on the institution. With the advent of digital technologies, especially the Internet and museums' presence on the World Wide Web, professional staffs and sophisticated data management practices are becoming the norm at even the smallest institutions.

Competencies

The competencies listed here outline the primary abilities needed to perform a range of tasks or functions within visual resources management. They can be used to assess a level of excellence for the visual resources manager or as a basis for training staff to perform a specific role in the image library. The professional organizations, VRA and ARLIS/NA, have published detailed studies and articles on the topic, which are listed in the "Visual Resources Management Resources" section.

Visual resources managers should have both broad and specialized subject knowledge in a field appropriate to the type of institution and/or library and information science. A minimum educational requirement for professional staff includes a postbaccalaureate degree in either area with

broad coursework or comprehensive on-the-job experience in the other area.

Managers and staff should access, use, and distribute information ethically and legally with attention to copyright guidelines and demonstrate a cooperative attitude, initiative, self-motivation, and the ability to advocate for and motivate others.

Managers should be effective instructors, capable of self-management and the management of others. They should help shape the future of their institution or organization and their profession. Successful managers will plan and manage projects, set and attain goals, establish workflows, and delegate tasks effectively. To keep staff informed and current, managers must have a broad understanding of technology issues and working knowledge of best practices in the areas of usability, interoperability, and digital preservation.

All visual resources staff should have the following skills and abilities for successful execution of their duties:

Organizational and time-management skills for priority setting, and setting and meeting deadlines
 Financial management skills including basic accounting, record-keeping, and reporting
 The skills necessary to ensure quality access, presentation, and preservation of digital image collections
 Flexibility in adapting to frequent changes in IT formats and methods of delivery
 The ability to select appropriate technological tools and apply them effectively, particularly those tools that are vital to caring for cultural collections, such as DAMS, DRMS, and photographic equipment

The Role of Professional Organizations

Attendance at professional meetings serves multiple purposes, but primarily extends training to include current issues. Several organizations offer one-day or longer workshops, sessions, meetings, and opportunities to get involved in the community and contribute to the shaping of this profession.

Further educational opportunities are available through annual workshops offered such as The Summer Educational Institute (SEI). The SEI is a joint VRA–ARLIS/NA program that provides a standardized and sustainable curriculum for training in image collection management. Each year, the focus on issues related to the transition from analog to digital collections becomes more relevant. The curriculum includes focused study on intellectual property rights, metadata, digital imaging, and discussions on current issues and expanding the role of the image management professional. Notification of like opportunities for specialized or in-depth investigation of a topic can be found by joining one or more professional organizations and subscribing to their listserv. There are multiple

opportunities every year to attend local and national meetings. For collections with limited budgets for professional travel, some have awards that are offered by application on a competitive basis.

Involvement is also considered a competency for effective management of visual collections. Contribution to the advancement of the visual resources profession involves knowledge sharing that includes publication and presentation of research findings and professional practices. Networking activities and participation in lifelong learning and professional development opportunities that build on existing knowledge and experience are also encouraged and necessary to remain current with the ever-changing landscape.

Planning and Administration

Whether a one-person department or the leader of a team of staff, a visual resources collection manager has a responsibility to plan for the future at all times. Departmental budgets and future planning are inextricably intertwined. Providing that the IT department absorbs costs related to software and asset management systems, specialized imaging equipment and qualified personnel are the primary expenditures when managing a VR collection, and the manager must communicate that essential need to budget preparers to meet user expectations over time. Equipment upgrade schedules (generally a two-year rotation) need to be communicated to and understood by the institution's IT department; in fact it is most effective if a VR staff person is assigned to keeping an equipment "wish list" current so that when budgets are prepared the most current needs can be addressed.

In the case of a larger staff, there are more management responsibilities. The department head must contribute to the recruitment, orientation, training, supervision, and evaluation of their staff. Securing and retaining qualified personnel is an ongoing concern. The skills necessary to providing seamless service are the direct result of appropriate levels of expertise and ongoing training. A good manager can contribute to the success of everyone on the team by advocating for further education and encouraging staff to stay current with best practices and to upgrade skills as opportunities become available. Staff training is continuous since new techniques and approaches are constantly being developed. Staff members must be good communicators with knowledge of the subject matter at hand and have a baseline expertise in software programs. For example, to work in an art museum, a fine art or art history background is expected in addition to technical competencies specific to their job.

The manager also sets the tone for open communication, cooperation, and team building, which is essential in an environment where deadlines are ever present and the needs of various departments will eventually overlap. Marketing key services of the department to staff is one way to create departmental support. Marketing can

include collaboration with other departments on institution-wide projects (such as a publication) or simply helping new staff to understand the role of visual resources within the institution. It is sometimes necessary for visual resources staff to willingly take on new responsibilities to grow with the needs of the institution. The manager sets the tone for the department's success.

CONCLUSION

Visual resources staffs play a vital role in the life of a cultural institution. The proliferation of images, in their various formats and for numerous uses, requires the attention of a professional manager to effectively acquire, manage, and circulate the collections. Guidelines for housing, cataloging, preserving, and distributing images are evolving at a rapid rate, especially since the introduction of digital formats in the mid-1990s. Since then, the focus on creating and distributing best practice guidelines has dominated the field and highlighted standards for quality that can be controlled and effected at the institutional level. Visual resources professionals are being acknowledged for their expertise in project management, copyright issues, digital technologies, and image creation and reuse.

Advances in digital imaging technology and image sharing methods are driving professional conference program content and conversations. Each year, new ideas about fair use of images, copyright interpretation, cataloging guidelines, image formats, and software advances are being published and presented at conferences. Digital formats and a variety of asset management systems have brought new scenarios for the profession and future generations of image users.

Volunteer Services in Cultural Institutions

Barbara Cohen-Stratyner

New York Public Library for the Performing Arts, New York, U.S.A.

Abstract

This entry offers a brief introduction to volunteerism in museums, science centers, historical societies and sites, and related mission-driven cultural institutions. It discusses the primary models and categories of public and institutional service to these cultural institutions, in common with and distinct from libraries. It points to the ways in which trends in population impact and change volunteerism and provides a guide to the growing bibliography and professional literature concerned with volunteerism and volunteer management.

INTRODUCTION

Museums and related institutions have a long tradition of volunteer participation. Many art museums and historical societies or sites were founded by their original volunteer corps. The primary mission of most institutions, “to collect and interpret” artifacts, generally relies on individuals presenting information to the public. That function is often shared among staff and different groups of volunteers. Volunteers serve many functions behind the scenes in institutions.

The contemporary movement to transform museums, like libraries, into culturally competent services also relates to volunteerism. The professional organizations in both fields recommend expanding the recruitment and use of volunteers from different age groups, from adolescence to senior citizens, and from the full range of communities and populations served (or targeted) by the institutions. Volunteers are seen more and more as change agents. Concurrently, the field of volunteer management has developed into a professional offshoot of nonprofit management.

HISTORY AND TRADITIONS OF VOLUNTEERISM

Volunteerism is considered a quintessential value in American culture. It has been linked to most political and social movements of the last three centuries and the literature that documents them. Volunteerism is an inherent factor in the social mission of museums and related institutions, that philosophy which distinguishes a museum from a collection. There are hundreds of definitions of volunteering, as that word is used in different contexts (see the Map of the Volunteer World on the Energize.com Web site). The social sciences study volunteering as it reflects and impacts on American life.^[1] The phrase “museums and related institutions” refers to museums,

historical societies and sites, parks, botanical gardens or arboreta, zoos and aquariums, children’s museums, and science and technology centers, as well as similar mission-driven organizations that display, preserve, and interpret artifacts or sites.

SERVICES TO PUBLIC

“Smile Desks”

The most common, traditional volunteer service is in orientation and greeting. There are “smile desks” at the entrances to most museums, in common with hospitals, libraries, public buildings, and many performing arts nonprofits. Typical statements of responsibilities include “welcome and directing the public, hand out support materials and answer questions about the grounds, programs, history and facilities.”^[2] As audiences change, “smile desks” are frequently staffed with volunteers able to answer questions and distribute information in multiple languages, learning modes, and such responses to Americans with Disabilities Act accommodations as Braille and large-print publications.

Many of the efforts to expand visitorship result in a parallel expansion of service points and hours. Museums with large education programs may have separate entrances for class visits. Free nights and concerts designed to attract young adults, “Gen-X and -Yers,” require additional “smile desks” and the volunteers to staff them.

In some institutions, the “smile desk” also serves as an admission desk or shop, which can require volunteers to handle funds. Responsibilities may also include institutional development services, such as selling memberships and donation forms. Other public service points that may require volunteers to handle identification documents or cash equivalents (credit cards, etc.) are distribution points

for the various forms of audio guides. This contentious issue may become moot if museums switch to audio content for visitors' own electronic equipment (cell phones, PDAs, etc.).

SERVICES SPECIFIC TO MUSEUMS

In general, docents are volunteers who have been trained by the museum professional staff to give tours of exhibitions, permanent galleries, or sites. A typical statement of the rewards of docent service can be found on the Oakland Museum site's volunteer page: "It's the excitement that comes with learning from top professionals in your chosen field. It's the opportunity to make new friends with people who have similar interests. It's being part of a great institution. Most of all, it's helping to ignite a spark in a young person's imagination, or the pleasure of leading visitors toward making discoveries that bring new insights about life in our great state."^[3]

Docents in Art and History Museums

Docents are required to obtain extensive training in the content and context of the collections, exhibitions and gallery artifacts, and in the educational philosophy of the institution. For example, the information for prospective docents in the Bruce Museum (Fairfield, Connecticut) Web site specifies that they be "interested in giving tours that generate conversations with their audience through questions (inquiry-based)," as well as being "the Museum's ambassador to the public [and] leading groups of children, teens, and/or adults."^[4] Training schedules vary, but generally include 1 year of intensive classes and observation, with required continuing education and curatorial talks.

Gallery Interpreters in Science Museums

In addition to docents, who are trained by the institution, science museums and centers often use young or retired scientists as gallery interpreters for specific exhibitions or projects that relate to the docents' academic field. They generally receive orientation to the exhibit or gallery and training in the educational style preferred by the institution, but not the general classes required by art and history museums.

Volunteers in Historical Societies

One set of functions that are associated with historical societies, houses, and sites are the use of large numbers of volunteers as costumed interpreters and reenactors. Their participation is vital since they provide not only large numbers, but also the range in ages needed to duplicate the extended families in historical populations. Institutions that recreate communities at specific periods in history engage both paid staff and volunteers to serve

specific roles or trades and seek out community members who know and can demonstrate those processes in the appropriate period manner. Connections are made through the modern-day equivalent, whether nonprofit based, such as 4-H Club members serving as farmers, or commercial, such as a knitting store or class providing spinning or knitting demonstrators. They are then trained in historical methods of production and in museum theater techniques of maintaining character.

Historical sites which are associated with battlegrounds or specific events require large number of volunteers as reenactors. Although they can also provide regularly scheduled services, they are most in demand at annual festivals and commemorations. The American Association for State and Local History's Technical Leaflet on *Planning Commemorations*^[5] credits volunteers as the "most important source of extra labor," providing reenactors and interpreters, but also law enforcement, medical staff, and support services. The authors, Andrew Dupstadt, Rob Boyette, and Sgt. Damian J.M. Smith, recommend partnering with local military organizations, ROTC programs, and local civic groups to obtain the volunteers.

Botanical Gardens

Botanical gardens frequently use volunteers as on-site demonstrators, modeling correct methods of garden preparation and maintenance or woodland rehabilitation, as appropriate to their sites. These institutions have also partnered with related local organizations, such as parks conservancies and outreach programs, to work with community gardening programs, *casitas* farming, or park restoration. A library of model volunteer manuals and application forms can be found on the Web site of the professional organization, <http://www.publicgardens.org>. In many urban centers, these projects serve as community access points (see below).^[6]

Additional Public Services

As nonprofit institutions increase partnering to improve community service, more opportunities are made available to volunteers that do not specifically relate to museum functions. These "floating" services with partnership cultural institutions generally focus on mentoring or enriched reading, literacy, and other forms of homework assistance, often involving before- or after-school programs. These services are discussed further in the section on community access.

INTERNAL SERVICES

Institutional Advancement

Volunteers also support the institutional advancement functions of institutions. They assist in fundraising

activities through event planning, invitation addressing, and acquisition of in-kind donations for events, especially auctions. In smaller institutions, they often manage membership services and communication. The cyclical relationship between volunteerism and membership is analyzed in the AASLH Technical Leaflet #237, "Membership Matters: Establishing a Vital Membership Program in Your Museum" (2007).^[7] Members become volunteers and provide contact information and service for membership drives. The required skills range from attractive handwriting to knowledge of computer hardware and software. As more volunteer applications are available online, institutions are increasing the detail provided for volunteering opportunities and the skills that are required. The Wave Hill application, for example, offers garden-specific and "indoors" opportunities and differentiates among a gallery attendant, business office assistant, development and membership assistant, family art project assistant, public program administrative assistant, public program assistant, public relations assistant, [and] shop attendant."^[11] Additional paraprofessional service can range from carpentry and embroidery, for a historic house, to gardening.

Museum Professionals as Volunteers

As the impact of the 2005 hurricane season on New Orleans and the area became known, the museum community itself organized corps of professionals giving volunteers service. Museums Helping Museums: A National Relief Effort for the Gulf Region linked the American Association of Museums (AAM) with affiliated and regional organizations of museums. A related effort was made by the American Association for State and Local History and American Institute for Conservation to form the History Emergency Assistance Recovery Team project. Together, these professional organizations, as well as Heritage Preservation, rescued artifacts, buildings, and staff in the impacted areas and provided models and professional education for disaster planning and recovery for the field.^[8,9] Many regional museum associations and related organizations have annual volunteering projects connected to their annual meetings, such as the Mid-Atlantic Association of Museum's "White Glove Gang," which sends registrars, conservators, and collections management staff to local small or understaffed museums for 2 days of service.

THE CHANGING FACE OF VOLUNTEERS

"Women's lib," the migration of women into professional careers, was considered a seismological sociological shift which resulted in studies of volunteers and their motivations. Challenging the widely held assumption that young adult women volunteered because it was expected of them

has resulted in literature which focused on volunteering as a means to serve self-expression and self-esteem (as discussed in Susan J. Ellis, *The Volunteer Recruitment and Membership Development Book*, 1996).^[10] More recently, studies of volunteerism have developed in parallel to visitor studies, resulting in empirical evaluations of volunteer expectations and motivations across gender^[11] and age categories.^[12] While very important in understanding volunteerism in American society, they have not specified museum service at all, but are more likely to lump it under "other." In addition, those studies that differentiate between "community action" and "civic engagement" do not specify into which category museum service falls.

FUTURE TRENDS

The Corporation for National and Community Service, in partnership with the Bureau of Labor Statistics and the U.S. Census Bureau, produces "a detailed breakdown of America's volunteering habits and patterns..." in *Volunteering in American: 2007 State Trends and Rankings in Civic Life*.^[13] In this most recent edition, the authors identify three age groups driving the growth in volunteering from 1974 to 2006: young adults, midlife adults, and older adults. (Introduction, pp. 3–4).

Young Adult Volunteers

The use of young adults as service providers has grown in libraries and cultural institutions. Many now put in hours of community volunteering for service organizations, such as the National Honor Society, graduation requirements, or such cultural coming-of-age traditions as B'nai Mitzvah programs. Museums and related institutions currently make up a very small percentage of teen volunteering opportunities.^[14] However, museums have developed and documented many creative programs to target and facilitate service by young adults. An early model for programs was provided by YouthALIVE (Youth Achievement through Learning, Involvement, Volunteering, and Employment), a 1991–1999 initiative of the Association of Science and Technology Centers (ASTC) with support from the Wallace-Reader's Digest Fund. Recognizing the participants in youth programs "develop intellectually . . . gain social competence . . . and learn about the world of work," ASTC institutions were urged to develop programs with adolescents. They were trained for visible volunteering positions, which included explainers/interpreters, who work in the galleries "involving visitors more directly with the exhibit by discussing concepts, answering questions, and providing assistance with the operation of exhibit" and demonstrators, who "work with mobile carts of stations in public areas where they lead activities."^[15]

Professional periodicals in both the library and museum fields have actively promoted the use of adolescents as volunteers in a variety of roles. The most reported in libraries and organizations that partner with libraries have been literacy and homework help programs that target adolescents to work with their peers and younger children. The American Library Association's guide to *Creating a full-service homework center in your library* (Cindy Mediavilla, 2001) described model programs in Minnesota, Queens, New York, and California, which use high school and college students provided with pay, no pay, and service learning credits. Elizabeth Lai wrote about the Toronto Public Library's model program for teens as successful literacy volunteers for reluctant readers in "The Buddy System" in *Children and Libraries*.^[16]

High school students are also now found in advisory councils for art and history museums and related institutions and serve in educational roles in galleries. In *Museum News* (September/October 2005), Deborah Schwartz analyzed programs in art and science museums across the country.^[17] The teenagers' roles in the museums include gallery explainers, peer docents, and advisory councils, as well as virtual volunteering (see below) in technologically advanced institutions. She points out that museums can attract adolescents with authentic experiences coupled with flexible informal learning opportunities, but that staff must be prepared and committed to the projects. The article, which was based on a panel presented at the 2005 AAM annual meeting, provides a list of 18 model programs across a range of institutions.

Midlife Adults

The Corporation for National and Community Service tracked a 30 year rise in volunteering by midlife adults (which they defined as 45–64 years old) and credited it to Baby Boomers. An analysis of this report published in *New York Nonprofit Press* (April 2007, p. 14) credited Boomers' education level and propensity to have children later in life. "Once their children leave, Baby Boomers could maintain relatively high volunteer rates because of the higher education levels and expectations that they will work later in life than previous generations."^[18] The highest retention rates were for volunteers who perform management activities ("such as strategic planning, volunteer management and coordination, and marketing"), rather than active public service, such as tutoring, mentoring, and coaching. The report recommended matching volunteers with appropriate and challenging assignments and provided professional development opportunities for volunteers ... to increase and sustain volunteer participation." These factors favor museum volunteer docent programs, which tend to require continuous training.

This population also gained from the rising trend in corporate support for cultural and service nonprofits—providing support for active volunteering, rather than, or as well as, funding. This trend grew from practices in specific industries, such as telecommunications and Silicon Valley, and has become widespread. Some firms target individual institutions or providers and design team-building volunteer activities for their staff. Others provide work-release, flex time, or annual leave programs for an employee's own choice of institutions or providers.^[19] Midlife adults also provide services through "virtual volunteering" (see below).

Older Populations

Volunteering in America 2007 notes that the volunteer rate for older adults (65 and older) increased over the last three decades. Volunteering offers social contact and a community of respect for older adults without impacting on pension or Social Security income. Longer life expectancy is expected to add to this trend, although it may be balanced by delays in retirement ages.

It is necessary to pay attention to services and access issues for volunteers as well as visitors. Age-related changes in vision, hearing, and mobility could have precluded older populations from volunteering, but museums now have much more information and access to services to provide accommodations that facilitate their continuing participation. Since museums and related institutions have 10 years of experience developing accommodations for visitors covered by the Americans with Disabilities Act, they can serve in leadership roles in working with volunteers with late life and ADA challenges.

VOLUNTEERS AND COMMUNITY ACCESS

Over the last decade, the progressive library literature has focused on public libraries as points of entry for new users, new immigrants, and new populations into their communities. Camilia Alire and Orlando Archibeque's *Serving Latino Communities: A How-To-Do-It Manual for Librarians*, 1998, exemplifies guidebooks for this movement toward culturally competent institutions. As they pointed out, institutions are expected to provide services that had previously been supported by other nonprofit or governmental entities, among them, English as a Second Language, adult literacy, citizenship and GED training, as well as immigrant law advisories. They provide a list of tips for recruiting Latino volunteers which can serve as a model for all volunteer managers in a much wider range of institutions. It begins "check out your current staff," to which we can include current volunteers; enlist the help of formal and informal community leaders; work with other institutions, from senior

citizen centers to recreation centers; and ends “invest in your young adults.”^[20]

Through partnerships, museums and, especially, urban historical societies have joined or supported libraries and immigrant-specific programs. Institutions and staff who had committed themselves to creating dialogic museums and the goals of civic engagement had long been promoting community advisory groups for facilities, interpretation, and exhibition planning. The 2002 issue of the *Journal of Museum Education* (volume 27, nos. 2&3), for example, focused entirely on community liaisons, community involvement, and off-site community programs. In AAM staff members Kim Igoe and Alexandra Marmion Roosa’s report on the AAM’s Museums and Community Initiative, they referred to volunteering in the “limitations of museum” section, citing complaints about “a homogeneous staff and volunteers” (p. 19).^[21] In response, museums have adopted from public libraries the important role of community connectors—advising the institutions to the community’s needs and notifying community members of the institutions’ willingness to serve. Most institutions use volunteers in these roles, but are, whenever possible, guiding them into professional training.^[22]

VOLUNTEER MANAGEMENT

The field of volunteer management itself has grown concurrent both with the changes in the volunteering population and the rise of academic study of nonprofit management. James Fisher’s *Leadership and Management of Volunteer Programs* (San Francisco: Jossey-Bass, 1993) cites S. J. Ellis and K. H. Noyes’ description of the three “historical categories of volunteer leadership: first, the member of a volunteer groups selected to be the leader. . . ; second, the paid staff person who supervises volunteers as a secondary responsibility. . . ; third, the staff person, full or part-time, paid or unpaid, whose primary function is to coordinate the work of volunteers.”^[23]

The rising number of volunteers who have or had had substantive professional careers is believed to have pushed the professionalism of management. The field mirrors most of the concerns of management and administration, including policies, risks, job or task descriptions, screening and selecting volunteers, supervision, assessment and ethics. Fisher, Ellis, and Noyes (now Noyes-Campbell) have written extensively on the field of volunteer administrators for publishers and imprints devoted to nonprofit management. Many of their examples relate to medical and community-based organizations, not museums. The American Council for the Arts and the AAM Volunteers published a standard text, a handbook for volunteer program administration specific to museums and related institutions in 1993. The AAM has updated it as *Transforming Museum Volunteering: A Practical Guide for Engaging 21st Century Volunteers*, by Ellen Hirzy. Online resource

libraries of special value to the field of volunteer management can be found on <http://www.energizeinc.com> and <http://www.managementhelp.org>.

IMPACT OF THE INTERNET

The Internet is changing the way people use libraries and museums. But the ways that institutional Web sites can be used to prepare for visits has not resulted in less need for volunteers. It has augmented and facilitated volunteer management. In her “Volunteer Line” column, Bonnie McCrae wrote on using the Internet for recruitment and training of volunteers, citing many resources for management, free technical support, and training.^[24]

The Internet has spawned a new group of volunteers available to cultural institutions. An additional change facilitated by the Internet lies in the growth of referring organizational sites that offer potential volunteers with a menu of opportunities for single-time or long-term commitments. In some areas, they are independent screening sites; in others, they are services of municipalities or nonprofits with wide-ranging projects. In the online version of *Library Journal*, the WebWatch section provides descriptions of three kinds of Internet-based services for volunteerism—general Web sites for nonprofit management that provides information for potential volunteers and sites that target specific age groups or professions.^[25]

“Virtual volunteerism” began in the IT field as programmers and other professionals donated their services to cultural and community nonprofits for the development of data bases, systems, and Web sites through TechSoup.com, NetAid.org, serviceleader.org, and similar projects. The term also now includes the virtual community that assists institutions through less specifically technological skills, such as researching and database preparation. Conhaim points out that these people can include “nontraditional” volunteers, who “travel too much . . . , have conditions that interfere with their mobility, [and] have unusual work schedules.”^[26] Jayne Craven has emphasized the value of virtual volunteers to institutions with her columns on Coyote Communications and TechSoup.^[27]

CONCLUSIONS

Cultural institutions are increasingly reliant on volunteers to serve the public, serve the institution, and present the institution and its mission to the public. Volunteerism provides institutions with their most immediate response to

societies' trends. Museums and other cultural institutions are developing an independent literature on volunteering and volunteer management, but the specific needs and opportunities of cultural volunteering have not yet been the focus on empirical studies. It remains a challenge to define institutions relationships with their volunteers, communities, and stakeholders.

Wayfinding and Signage

Dennis O'Brien

Maps and Wayfinding, LLC, Mystic, Connecticut, U.S.A.

Abstract

The mental processes, physical elements, and materials involved in wayfinding and wayfinding signage are explored. Wayfinding is defined, and thematic and physical wayfinding are distinguished. The professions doing wayfinding design are described; copious examples of such design are provided. The importance and character of signage are developed, and the histories of both wayfinding and signage are briefly described. Detailed information on common types of substrates and additives for both fixed-content and nonelectric changeable-content signs is provided in tabular form.

INTRODUCTION

There are an estimated 117,000 libraries and 17,500 museums of all kinds in the United States today.^[1] Through all those public institutions, and so many others, there is a steady stream of visitors, some of whom have no idea how to get where they are going, or how they will find what they want when they get there. Resolving these shortcomings is the job of wayfinding and signage. Wayfinding is a research, design, manufacturing, and installation discipline practiced mostly by professionals for the benefit of all people who need to move around in the digital and real-worlds.

In its practical application, wayfinding is a coordinated program. This program includes how people think about their institution and its visitors, what programs and information are made available to those visitors, and what physical spaces and objects are provided for visitors' wayfinding use. Signage of all types is an important part of any wayfinding program.

use of color, lighting, and type styles might set the theme for an exhibit, separating it from other spaces and uses. In a library the themes of the spaces are more straightforward.

Physical wayfinding deals with a person's understanding of, orientation to, and navigation and movement through a space. This entry will deal with physical wayfinding, primarily in libraries and museums, calling it, simply wayfinding. Many of the concepts and principals discussed can be applied to thematic wayfinding as well.

In short, wayfinding can allow an institution to present a welcoming attitude toward its visitors. This is referred to as an institution's *visitability*. *Visitability* encompasses every aspect of an institution's amenities, offerings, and creature comforts no matter how small or large, and addresses whether or not they are sufficient and of high enough quality for all visitors.

Wayfinding can be defined as the *mental processes* and *physical elements* needed for people to recognize and understand an environment, orient themselves, and move around.

Mental processes

Research in neuroscience beginning in the early 1990s has allowed researchers to pinpoint which areas of the brain are functioning during various wayfinding activities. Using functional magnetic resonance imaging (fMRI) and positron emission tomography (PET) scanning techniques, researchers are able to "see" brain function in real time as test subjects perform recognition, orientation, and navigation tasks in both familiar and unfamiliar virtual environments.^[2,3] For example, it was found that the right hippocampus and right caudate nucleus areas of the brain are associated, respectively, with knowing and navigating place locations accurately, and doing so quickly.^[4]

The wayfinding process is different for different people. All humans, however, use their senses and various parts of their brains to follow two broad patterns while

WAYFINDING

Definition and Types

Wayfinding should be thought of as a coordinated plan of policies, physical elements, and programs designed to make that facility's form, structure, contents, amenities, and offerings recognizable and accessible—or "transparent"—to the visitors. It can welcome visitors, ease their new-space anxieties, tell them where they are, guide them to where they are going, and, most important, remove any barriers that might get in the way of visitors' receptivity, involvement, enjoyment, and learning.

Two forms of wayfinding are "Thematic" and "Physical." Thematic wayfinding deals with why a person is in a place, and what that person might expect. In a museum, the

wayfinding through a space. The first is recollection of other experiences. The second, called topology, is a recognition and use of enclosure, order, proximity, and separation in spatial relationships.^[5] Along with these patterns, wayfinding in general has two parts: making decisions, and moving. Decisions on how to move are based on the mode of movement to use, time constraints, movement speed and direction, and what route to follow.^[6]

Within these patterns and parts, the five steps in the wayfinding process could be listed as follows:

1. Recognition. What is this place? What's familiar? What's unfamiliar?
2. Orientation. Where am I? Where am I going?
3. Understanding. Why am I here? What will I do here?
4. Navigation. How will I get there? How will I move next? How will I get back?
5. Debriefing. What has been the outcome of my visit? Would I recommend it or do it again?

The sequence from 1 to 3 has a thematic component, and can sometimes proceed in another order. Some of these processes occur remotely, before a visitor ever leaves home. The acronym created by the first letters of the five wayfinding processes is R-O-U-N-D. This is a useful way to remember that any visit involves not only the whole of each visitor's abilities, but also starts and ends in the same place.

Museum visitors practice recreational wayfinding,^[7] which may include specific objectives or destinations, but is primarily to explore and enjoy a setting. Library visitors are much more likely to practice directed or goal-oriented wayfinding activities combined with occasional explorations.^[8] During any activity, people sort out their surroundings by forming cognitive maps.

The Cognitive Map. The most important mental process practiced by humans while interacting with spaces is cognitive mapping, described as "...the process by which an organism makes representations of its environment in its brain."^[9] All people form "maps" in their minds of the environments they experience. When visiting a familiar place, people form cognitive maps before they begin. In unfamiliar spaces, maps can only be formed on the go.^[10] These "maps" have an enormous impact on any visitor's behavior. The formation process has two parts: the person's background knowledge and his or her experience of the environment.

Background knowledge refers to information, experiences, and skills people carry with them. These include the following categories common to all humans:

1. Biological. Bilateral symmetry (the two sides of our bodies are more or less mirrors of one-another); two distinct genders—with differences in wayfinding strategies;^[6] balance; major sensory organs except touch located in our heads; and bodily functions.

2. Environmental. Spatial and aesthetic sensibilities; and the human conditions that new spaces cause anxiety, and order is comfortable while disorder is not.^[11]
3. Cultural. Conventions and ethics; language; behavior; and architectural shapes and landmark recognition.
4. Personal. Level of education; degree of interest in a subject; physical and mental abilities; social skills; and age.

Each person's mental map is unique based on his or her abilities of sight, hearing, smell, taste, touch, reasoning, and sense of time; and each map serves the orientation and navigation needs of its creator. Therefore, mental maps do not necessarily resemble conventional maps. A mental "picture" of a place created by a person who is blind, for example, would be far different from one created by a sighted person.

Physical elements

The physical elements available to a visitor for purposes of wayfinding can be grouped into four general categories: spaces, structures, objects, and content. They are hardly ever used in isolation, one from another, nor are they necessarily encountered in that order.

Properly designed and sequenced, physical elements allow visitors to undertake their own personal mental processes, and progress from introduction to decisions to action in a smooth continuum. To facilitate these activities, spaces, structures, objects, and wayfinding content must be "legible." Legibility means presented clearly and plainly, and able to be read. Since physical elements are meant to be accessed, approached, entered, moved throughout, and exited, it is necessary that they possess unmistakable *positive attributes* in order to function well.

Positive attributes of physical elements in alphabetical order, with examples:

1. Circulation. Logic of flow plays an important part in visitors' comfort, understanding, and use of space, and any institution's visitability and marketing effort. Circulation necessarily proceeds from the macro (airports, highways, parking lots) to the micro (exhibits, rest rooms, benches) by way of:
 - a. Paths. The routes available for movement.
 - b. Edges. The boundaries or barriers between regions or elements.
 - c. Districts. Identifiable regions into which, and out of which, visitors can move.
 - d. Nodes. Locations on which visitors can focus and into which they can enter. They may be intersections, activity centers, or convergences of paths.
 - e. Landmarks. Points of focus, like nodes, but primarily important to visitors at a distance for direction or orientation.^[12]

2. **Clarity.** Understanding of the form and function of practical elements should be easy to acquire: Information should be presented in languages or symbols understandable by the majority of visitors.
3. **Cleanliness.** Clutter and dirt can be disorienting, unappealing, or dangerous: Clean rest rooms, for example, are essential for visitors' well-being, and are an important part of an institution's marketing and visitability.
4. **Clues.** Functioning parts need to have their operation apparent in their design: It should be obvious from the look and feel of a door's handle, for example, whether it is meant to be pushed, pulled, or turned.
5. **Comfort.** An environment should be psychologically and physically easy to use, and provide creature comforts: Low sound levels usually calm and soothe people, and contribute to a facility's marketing and visitability.
6. **Communication.** Physical elements can be designed and located in order to telegraph their functions: Large ornate centrally located doorways say "grand entrance."
7. **Community.** Environments should be designed with an overall sense of inclusion: Physical features designed to accommodate visitors with disabilities commonly function better for all visitors. This is the basis of *Universal Design*, defined as: Physical sites, systems, and attitudes that are designed and built to accommodate as wide a range of people as possible with the fewest exceptions or special cases.
8. **Completeness.** If a facility needs something that is not there, it is incomplete: Providing staff members for wayfinding assistance is fairly common, but if the personnel are not properly trained, supported, equipped, dressed, and positioned for the task, their presence and function are incomplete.
9. **Composition.** Environmental elements should be shaped, sized, scaled, colored, positioned, oriented, and related to one another in ways that enhance visitors' awareness and improve visitor movement: Any given wall can be an impediment to movement, or a channel for it.
10. **Concept.** Having a general theme for a physical place enhances the visitor experience and an institution's mission and visitability: During the nineteenth century, the concepts of "library" and "museum" were imprinted on the conscience of Americans using imposing architecture.
11. **Conciseness.** An environment should include all the information needed but no more: Simpler is better.
12. **Conservation.** Physical elements can be installed to increase public awareness of existing problems; to prevent environmental degradation of sensitive areas by visitors; and, by using sustainable and nontoxic materials, as ecological solutions in themselves.
13. **Consistency.** Once an element is presented in a certain way, that presentation should remain the same throughout all uses: Identical waste receptacles placed on the right side of each public door would be an example of a constant.
14. **Conspicuousness.** Elements should be sized and placed according to their use: Interior spaces intended as gathering areas should be large, centrally located, and easily accessed by multiple routes; restrooms can be "tucked away" as long as paths to them are clear.
15. **Contrast.** Elements with different functions should be distinguishable as such: A glass door should not look like a glass window; light gray words do not show up on white backgrounds.
16. **Control.** Periodic evaluation of a facility is necessary to stay informed about subjects such as safety, security, cleanliness, and relevance to visitors: Evaluation must be accompanied by a willingness to update obsolete or dysfunctional elements as needed.
17. **Conventions.** Conventions are commonly agreed upon standards or rules: Using yellow as a warning color is an example of a convention.
18. **Correctness.** Elements should be as accurate as possible: The phrase "visitor services" has come to mean information available about attractions outside a facility. It is used incorrectly, then, on signage to refer to amenities inside a facility, such as a food service or restroom.
19. **Correlation.** Wayfinding visuals should agree with the facility they represent in overall layout and in their details: A 45° left turn would not correlate with a sign arrow pointing 90° left.
20. **Creativity.** A pretty, innovative, or engaging environment will enhance visitor appeal, prolong involvement, and stimulate absorption: A willingness to break new ground in design approach, materials, and function is important.
21. **Current.** Environments should be kept up to date: Evolving, repairing, and improving might all be needed to meet the needs of visitors and maintain an institution's visitability.^[13]

These positive attributes should be incorporated into the four general categories of *Physical Elements*:

Physical Elements categories in order from the macro to the micro:

Spaces. We humans have a long background of relating our location to that of the sun, moon, and stars. In outdoor settings that relationship is used, sometimes unconsciously, for orientation. On a more regional scale, landmarks such as mountains, hills, and rivers offer the same opportunities. Locally, visual recognition of landmarks and vistas can impact how a

visitor recognizes a place, chooses a direction, or follows a route.

Structures. Built environments fall into only a few broad categories of usage: residential, commercial, industrial, recreational, educational, medical, and governmental. Generic elements used to sculpt structures for wayfinding include spaces, shapes, relative scale, colors, paths, textures, boundaries, sight lines, lighting, sound, and temperatures. These qualities are embodied in specific elements such as doors, windows, walls, or stairs. To the largest extent possible, these elements should be designed and constructed as part of a master wayfinding program, adhere to the qualities of “legibility,” be aesthetically pleasing, and be composed of sustainable and nontoxic materials.

Objects. Objects refers to any built or manufactured element smaller than a structure. This could include something as large as an information desk or as small as a doorknob. This also includes signs and printed materials of all kinds. As with structures, all objects should be designed, installed, and operated as part of a master wayfinding program, adhere to the qualities of “legibility,” be attractive, and be made of sustainable and nontoxic materials whenever possible.

Content. In order to function for wayfinding, spaces, structures, and objects need content. Beside the general elements of color, shape, etc., content also refers to more explicit components in the environment as well as on published pieces and the Web. Virtually all content is rendered in digital form at some point before being used in its final form. There are five general categories of content:

1. Graphics. Drawings, diagrams, schematics, and other representations are more commonly used for exhibits and displays, but occasionally come in handy for wayfinding.

A map is the most common nonsymbol graphic used for wayfinding. It is also the most popular wayfinding tool sought by visitors after a knowledgeable staff member.^[14] Map design and illustration should conform to the 21 positive attributes listed above. There are only two basic illustration styles for all maps: a plan view from directly overhead and one of a variety of bird’s-eye-views from some side angle. Varieties of these two styles is common. See Fig. 1 for an example of a combination view map. An attractive map also works well as a branding and marketing tool and enhances an institution’s visitability.

2. Images. Photographs, videos, scale models, and reenactments are popular for printed pieces, computer installations, kiosks, and introductory theater presentations. They are used less for non-electronic wayfinding signage, but are used extensively in interpretive installations. See Fig. 2 for a scale model.

3. People. A knowledgeable staff member, properly trained and located, can be the most successful component in an institution’s wayfinding program, and is the source of information most sought after by visitors to museums and libraries.^[14]
4. Symbols. Recognized standard colors and graphic symbols for accessibility, activities, direction, lodging, services, transportation, and warning are essential for legible communication, and particularly for comprehension by people who do not read the written language in any given location.^[15]^[16] Institutional logos or corporate marks can also serve as devices for identity, branding, promotion, marketing, and enhancing visitability. See Figs. 3–5.
5. Text. The written word constitutes the bulk of content when signage, printed media, and electronic devices are considered. The use of text on wayfinding signs is usually minimal and in large sizes. Several requirements for appropriate type styles, contrast with background, height-to-width ratio, stroke width-to-height ratio, and height-to-viewing distance are set down in the Americans with Disabilities Act (ADA) of 1991, and other sources.^[17]

People and Wayfinding

Who needs wayfinding?

Anyone who moves about by any means in an unfamiliar environment needs wayfinding assistance, each according to his or her reasons for visiting, mental processes, and physical abilities.

It is important to emphasize that “visitors” does not just mean the customers who walk through the front door of a facility. Visitors must also include staff, volunteers, and service or materials suppliers. Due to their specific service and wayfinding needs, these various categories of people must sometimes share space congenially and safely, but are sometimes intentionally kept separate. All their wayfinding needs must therefore be successfully addressed. It is not good planning, for example, to provide wheelchair access at the front door, only to neglect an efficient means of refuse removal out back. All functions of a facility directly or indirectly impact visitors’ uses of that facility.

Who designs wayfinding?

Several professional disciplines have responsibility for understanding wayfinding behavior—vital for providing wayfinding programs and signage systems—and creating and installing spaces, structures, objects, and content suitable for use by visitors. Wayfinding is interdisciplinary, and these professionals often work in concert. These are

Fig. 1 You-Are-Here map of Huguenot Historical Society, New Paltz, New York. The layout is a plan view of the property, while the buildings are illustrated in a bird's-eye-view. Design by the author.

the most common professions, in broad categories, listed alphabetically:

1. Architects. People who are responsible for planning, designing, and constructing buildings, their mechanical systems, and their attending environs. Architects
2. Consultants. People called in to advise on a project due to their skill or knowledge in a specific

must be familiar with building materials, local and federal regulations governing all aspects of structures, use of space, and aesthetics.

Fig. 2 The three-dimensional tactile map of the U.S. Capital area used for orientation in the Capital Building, Washington, D.C.

Fig. 3 The four accessibility symbols required by the Americans with Disability Act of 1991(4). From left to right they are the international symbols of Accessibility, Access for Hearing Loss, Telecommunications Device for the Deaf (TDD), and Volume Control. There are thousands of other “standard” symbols available, worldwide.

discipline or area of expertise. Anyone involved in a project for an institution who is not employed there can be considered a consultant.

3. **Contractors.** People responsible for constructing a facility. They must have knowledge of materials, building practices, and regulations. The discipline can include carpenters, steel workers, plumbers, electricians, masons, or construction managers.
4. **Designers.** Plan and create spaces, structures, objects, or content in a specific discipline or area of specialization. Their output is, in turn, used by fabricators and contractors to build and install the designed elements. Designers can work in areas such as graphics, industrial products and processes, wayfinding, computers, fashion, lighting, sound, or automobiles.
5. **Engineers.** Responsible for the detailed structure, fabrication, and operation of any technologically complex object, environment, or process. They can work in disciplines such as aerospace, chemistry, communications, computers, construction, the environment, fluids, light, and sound.
6. **Fabricators.** Build and install components of facilities such as signage, exhibits, furniture, or cabinetry, rather than the whole facility. Fabricators must be

familiar with the materials and manufacturing processes of their discipline, and often have design experience as well.

7. **Landscape architects.** Concentrate primarily on everything outside of structures. This discipline does not concern itself only with land and plants, but can include creating all manner of outdoor facilities such as paths, walls, out-buildings, patios, and installations involving water.
8. **Planners.** Formulate strategies for short- or long-term change or growth in an area or institution, often incorporating programs, policies, and development as well as structures and other physical elements.
9. **Psychologists.** Study issues relating to the function of the human mind. They can operate in many disciplines. The most important for wayfinding is environmental psychology, which is focused on the relationship between humans and the physical world.
10. **Sociologists.** Study issues of human associations in groups such as societies and cultures. They, too, can function in one of several sub-disciplines, and as such, can contribute valuable insights into human relations with specific categories of public institutions.

History of Wayfinding

The many elements contained in modern wayfinding were not all developed simultaneously. Some, not surprising, are far older than others.

Maps. Maps are the oldest form of wayfinding communication, preceding both written and numeric language in the upper Paleolithic.^[18]

One of the earliest graphics that is clearly a map came from Nuzi in northeast Iraq, and dates to 2500–2300 B.C.^[19] Egyptians, too, developed a sophisticated tradition of measured mapping by 2000 B.C.

Very little evidence exists that the Greeks, centuries later, had much time to advance the art of map-making on a local level, or contemplate itineraries, the forerunners to guidebooks and road maps.^[20]

The Imperial Romans were avid travelers, and, unlike the Greeks, had detailed *Itinerarium* (guide books) and to-scale you-are-here maps to assist them on their journeys. Caesar Augustus had a large version of a map of the entire Roman Empire produced by Agrippa around 19 B.C. engraved in marble in 7 B.C., and installed near the Pantheon. It is quite possible that this map and its copies throughout the Empire were the prototypes on which the first Roman *itinerarium* were based.^[21] By A.D. 200, *itinerarium* were produced on papyrus and leather-bound.^[22]

Two types of *itinerarium* existed in Imperial Rome. Of the first type, written guidebooks without maps, the best known is probably *Guide Book of Greece*, written between A.D. 160 and A.D. 180 by Pausanias.^[23] Pausanias was so thorough that his guidebook was still popular among nineteenth century travelers, and can be considered the direct precursor of the *Guide Bleus* and the guidebooks of Karl Baedeker.^[24]

Of the second type of *itinerarium*, maps with scant text, the lone existing example is an eleventh- or twelfth-century copy of a third-century original known as the Peutinger Map (*Tabula Peutingeriana*), named after Konrad Peutinger who discovered it. The map covers the Roman Empire from India to Britain. It was designed and constructed to fold and fit into a carrying case.^[25,26] The

Peutinger Map included accurate road distances, illustrated symbols representing different size cities, temples, lighthouses, spas, bathing facilities, forts, imperial residences, way-stations, and sketches of trees representing the forest regions of Germany and Syria.^[26]

Advancements in the skill of map-making all but ceased during the period from about 500–1000 A.D. For the period referred to as the Middle Ages, the Christian Church promulgated its own theories about the world, subjecting virtually every human endeavor, including representing the physical world, to its mindset. During this period, countless works of geography and cartography were suppressed or destroyed by church officials.^[27–31]

The tradition of the measured survey that had been almost lost in Western cultures since the fall of Imperial Rome reappeared in Europe between the ninth and twelfth centuries with the copying of the Roman treatises on estate surveying.^[32] The *Chronica majora* (1253) was an update of the Roman itinerary designed and illustrated by the English Benedictine monk Matthew Paris. At the same time this type of “strip map” was a more sophisticated version of the Peutinger Map style of illustration, it was the beginning of the future of European cartography.^[33,34]

Not long after, and continuing up to the present day, maps improved in accuracy, and depicted closer relationships to the world they represented. Thus, the strip map, as useful as it had proved for so long, gave way to a map style showing a truer network of roads. This tradition, of course, corresponded with the ever more complex matrix of roads available for travel throughout most of the world.^[35]

Wayfinding devices. The first known appearance of the wheel was around 3500 B.C. in Mesopotamia, with roads, bridges, way-markers, and road maps following shortly thereafter.^[36] There were also post stations at intervals manned by grooms, and containing itineraries—papyrus maps—showing distances between posts.^[37]

Like the Persian roads, Egyptian roads were dotted with posts to assist travelers.^[37] The Egyptian desert roads were marked with “stone cairns and also, it is suggested, by an occasional glyph that gave directions or distance.”^[38]

The Greeks employed a more rudimentary system of marking distances on their roads from that of the Egyptians by placing simple piles of stones, and, later, *hermae*—square stone pillars with busts of Mercury on top—in towns.^[39]

Traveling for pleasure and culture started in earnest with the Imperial Romans. As a result, wayfinding, including well-made roads, directional signage, mile markers, inns, guidebooks, “fast food,” and guides, were firmly established by the second century A.D.^[40] The Roman *Miliaria*, or milestones, are of particular importance as the grand ancestors of wayfinding objects. They were huge cylindrical columns of stone, usually over six feet high and weighing two tons or more, positioned on all Roman roads every 1000 paces (a Roman mile) after 123 B.C. They contained a wealth of information often including

the distance from the town where the road originated, the name and titles of the originating emperor, and sometimes the builders' names and completion dates.^[36]

As an important component of wayfinding, tourist guides in the ancient world were quite common.^[41,42] The Greek Herodotus (ca. 424 B.C.), for example, traveled extensively and relied on priests and locals everywhere he went for information.^[43] In another example, the city of Pompeii, when unearthed from its volcanic grave of A.D. 79, was found to be primarily a seaside resort town specializing in tourists and soldiers on leave.^[44] Under those circumstances, it can be assumed that there were ample guides on hand for all manner of assistance.^[45]

From approximately A.D. 500 to A.D. 1000, travel in the Western world was both sparse and hazardous: "Where the barbarians had passed, the roads, communication systems and inns that the Romans had built fell apart."^[46]

From around 1000 A.D. to the middle of the thirteenth century, travel for the benefits of pilgrimage steadily increased. By the fifteenth century travel for pursuits religious and secular were on the rise all over Europe and the Middle East. These travelers enjoyed businesses providing nearly all the wayfinding amenities of today's tourism: assistance bureaus, beggars, guidebooks, inns, outdoor signage, promotional literature, roadside fast food stands, digestive problems, travel agencies, and travel books.^[47,48]

Another way in which tourism and accompanying wayfinding evolved slowly during the eighteenth century, and more rapidly during the nineteenth, was in the number and relative affluence of the travelers. Also, during the eighteenth century, museums, zoos, and botanical gardens began opening to the public, while public libraries mushroomed in number and popularity during the nineteenth century.

SIGNAGE

Definition

The definition of "sign" is any object containing graphic displays of text and/or visuals intended to communicate information. This is a broad definition, and includes, in practical installations, a necessarily diverse array of stationary, mobile, non-electric, and electric objects.

See Table 1 for a listing of the most common signage substrate materials for fixed or changeable signs, content materials applied to substrates, and nonelectric changeable sign types.^[49] See Table 2 for expected outcomes of a successful wayfinding and signage program.

Two general design principals

Two overarching design principals guide the creation of wayfinding signage programs:

1. A system of wayfinding signs must have a consistent look throughout. This refers to structure, content, and placement. See Fig. 6 for an example of a signage program for the interior of a library.

Repetition and consistency of look and usage throughout a signage program is key to successfully funneling visitors in toward a facility, and guiding them through it. Imagery should be recognizable as visually and thematically consistent every time it is used, including a Web site, building graphics and signs, handout maps and brochures, and ID badges. To compliment any branding or marketing program this repetition and consistency should be incorporated into non-wayfinding uses.

Federal, state, and local regulations often dictate the size, design, and placement parameters within which a signage program is achieved, in whole or in part. Working within regulations requires familiarity with personnel and regulations, patience, flexibility, and innovation.

2. A wayfinding signage program should have elements that are plain, simple, uncluttered, and stylistically distinct from all other visuals throughout a facility. Complying with the regulations for proper use of signage set down in the Americans with Disabilities Act^[17] will go a long way toward achieving this.

History of Signage

Evidence for signs communicating specific information such as advertising a shop's wares seems meager until Dynastic Egypt. Egyptian shops did, on occasion, have signs advertising their products or services with inscriptions and visuals.^[50] The prolific Greek signage primarily took the shape of carved or painted images affixed to the outsides of various establishments. The images were designed and rendered to represent the wares or services offered within, and thus became the historic precedent for shingle signs as well as trademarks.^[51] See Fig. 7 for a modern example of both in one sign.

By the time of Imperial Rome, there existed about the same level of signage as a typical contemporary American shopping mall. Business identification, advertising signs, political and opinion placards, billboards, sporting marquees, graffiti, and banners competed for the attention of the public.^[52,53] Written and pictorial street signs were also common, but more often they were made of stone or terra-cotta relief and "let into the pilasters at the side of the open shop-fronts." Some streets even derived their names from signs of businesses displayed along them.^[50] This is very well documented because of the approximately 900 shop signs unearthed from the volcanic ruins of Pompeii and Herculaneum.^[52,53]

After 1000 A.D. The Roman pictorial tradition in signs had evolved in two ways. First, the relief and painted signs

Table 1 Most commonly used sign materials.

Category/ brand	Material contents	Strength	Durability	Look/sizes	Formation process	Compatible materials	Installation locations	Relative cost	Uses
Substrates^a									
A. Paper, <u>Illustration</u> <u>Board</u> , <u>Posterboard</u> , <u>Cardboard</u>	Paper, wood, cloth; sometimes recycled, sometimes plasticized.	Low	Short term	Matte, glossy, smooth, or rough depending on process. Paper: all colors Boards: most colors. Various sizes.	Water squeezed out of pulp mat with a binder rolled or pressed.	Wet or dry traditional media. Glued 2D/3D objects. Digital inks. ^b Self-stick products.	Interior mostly.	Low	Professional and amateur posters, notices, signs, announcements. Hung or folded self-standing. Recyclable.
B. Foam board	Polystyrene foam core, clay-coat paper.	Medium	Long term. Easily dented.	Matte surfaces. White, black, gray, several colors. Self- stick surfaces available. 4' × 8' sheets 1/8"– 1" thick	Extruded polystyrene core. Laminated both sides with high- quality clay- coated paper.	Wet or dry traditional media. Glued 2D/3D objects. Digital inks. ^b Self-stick products.	Interior mostly.	Low	Professional and amateur posters, notices, signs, announcements. Hung or folded self-standing. Recyclable. Cuttable, foldable for model making and display. Archival, flame retardant, and memory foam available.
C. Medium density overlay (MDO)	Exterior-grade plywood with high resin solid overlays. Phenolic on both sides, UV curing available.	Very high	Very-long term	Smooth surfaces Minimum grain. Wood color. 4' (w). 8', 10', or 12' (l). 5/16"–3/4" thick	Multiple wood layers glued under pressure. Coated.	Paint, coatings, self- sticks. Can be nailed, sawed, routed, and glued.	Exterior	Medium to high	For permanent installations.
D. Alucobond	Polyethylene core. Aluminum faces (85% recycled aluminum)	High	Very-long term	Virtually any color or finish; 4'2 × 14'2" sheets, 5'2" × 16'4" sheets, 3, 4, or 6 mm thick	Solid polyethylene core bonded to 2.02" sheets of Kynar system painted aluminum.	Can be folded, bent, cut, painted, or printed.	Interior or exterior	High	Architecture, display, signs, cladding.
E. Coroplast [Cloroplast]	Corrugated plastic	Low to medium	Long term	Varied surfaces; many colors; additives: anti- UV, flame retardant, anti- static/	High impact polypropylene copolymer extruded twin- wall corrugated sheets [<i>recycled material</i>]	Screen printing, paint, self-sticks. Can be die cut, cut, hot air/sonic welded, and glued into custom shapes/packaging.	Interior or exterior	Low	Packaging, display, signs.

F. Banner Vinyl (Vinyl/nylon) [Nylon]	Organic ethenyl (Combination) [Polyamide]	High	Long term to medium term (exterior use)	corrosion, custom colors, etc.; Widths to 106". 2–10 mm thick. Gloss/semi finish (Matte finish, woven look) [Woven, "rip-stop"]. Any color; Standard/custom sizes—16' width, any length.	Extruded strands woven to cloth.	Print inks, paints, self-sticks, appliques.	Interior or exterior	Medium	Signs, displays, flags, backdrops. Flame retardant.
G. Sintra, Komatex, Celtec	PVC plastic	Low to high (depending on thickness)	Long term	Matte surfaces, 12 homogeneous colors; 4' × 8', 5' × 10' sheets. 1, 2, 3, 4, 5, 6, 10, 13, or 19 mm thick	Closed-cell high-density expanded polyvinyl chloride sheets.	Can be heat/vacuum formed, bent, sawed, cut (to 3 mm). Print, paint (in some, products), self-stick, glued, screwed, riveted.	Interior or exterior	High	Signs, display, shapes, 3D products.
H. High impact styrene (Styrofoam)	Thermoplastic	High (Low)	Long term	Glossy surfaces. Clear, many colors; 4' × 8' sheets. 0.02", 0.03", 0.04", 0.06", 0.08", 0.1", 0.125", or 0.187" (Expandable foam) thick	Petroleum based polymer. (Expanded polystyrene)	Paint, self-sticks, sawed, cut, drilled, sheared, punched, heat/vacuum formed. (Molded)	Interior or exterior	Medium	Signs, esp. ADA, displays, 3D products (Insulation, packaging)
I. <u>Uvex</u> , <u>Gemex</u>	Cellulose, acetate, butyrate.	High	Long term	High-glossy faces, UV resistant; 4' × 8' sheets, 0.06"–0.25" thick. Film rolls: 0.003–0.03"	Cellulose modified by butyric and acetic acids. Non-petroleum, renewable resource.	Inks, paints, self-sticks, colorants.	Interior or exterior	Medium	For signs, displays, individual letters. As panels for illuminated signs.

(Continued)

Table 1 Most commonly used sign materials. (Continued)

Category/ brand	Material contents	Strength	Durability	Look/sizes	Formation process	Compatible materials	Installation locations	Relative cost	Uses
<u>J. Wood</u>	Pine, Cedar [Redwood]	Medium to high	Long to medium term (exterior use)	Coated/ finished to any luster; To 12" w × 6" thick 16" l	Cut, milled, cured trees. Sometimes coated or impregnated.	Self-sticks, ink, paint. Can be sawed, cut, sandblasted, etc.	Interior or exterior. Coatings extend life.	Low to medium	Signs, displays, 3D products, letters. Easy to work. [Used less frequently] Recyclable.
<u>K. Metal</u>	Bronze, brass, aluminum. [Steel]	High	Long term	Glossy, matte, brushed, textured surfaces; Shapes and sizes: standard/ custom by manufacturer.	Molded/cast formed from raw/ recycled materials.	Paint, self-sticks, printed, cut, drilled, sheared, punched, bent, sand/water blasted, molded.	Interior or exterior	High	For signs, displays, architectural/3D elements, bases for other materials, letters. [Magnetic]
<u>L. X-board</u>	97% postconsumer paper waste, organic adhesives.	High and crush resistant.	Long term (Interior)	Matte to glossy. White surfaces: 1200 (w) × 2440 or 2900 mm. 10, 12, 16, 20, or 32 mm thick.	Stiff paper surfaces bonded to a honeycomb interior.	Self-sticks, paint, print, laminated with veneers. Can be cut, sawed, and miter folded.	Interior	Medium	Signs, walls, 3D products, furniture. Recyclable.
<u>M. Paperstone</u>	100% FSC certified recycled paper, water- based phenolic resin with cashew nut shell binder, pigments.	High	Long	Grainless panels: 60" × 144". ¾", 1", and 1¼". 6 standard edges Custom by manufacturer.	Heat and pressure. Can be pressure "embossed" for signage.	Paints, coatings. Can be worked like hardwood.	Interior or exterior	Medium	Signs, esp. ADA. Counter tops and other architectural uses.
<u>N. Medium-density fiberboard (MDF, MDFB, Customwood, Craftwood) [Particle board]</u>	Soft wood fibers, binders, resins. Sometimes scrap/ waste wood, bamboo, glass, steel, recycled paper. [Larger particles, different glues]	High	Long term interior use, exterior when sealed	Grainless various surfaces or Green: moisture resistant. Red: fire retardant. 2.5–30 mm thick. Sizes standard/ custom by manufacturer.	Fibered materials combined with resins under heat and pressure.	Paints, inks, self- sticks, veneers. Can be sawed, cut, routed, etc., like plywood.	Primarily interior. [Not good with water/ humidity]	Lower than wood	Architectural/3D products, furniture. Signs, displays. Can be made from recycled materials and also be recyclable.

Surface additives

A. Adhesive vinyl	Polyvinyl chloride (PVC), plasticizers.	High	Long term (interior use).	Matte to glossy. Dozens of colors, clear, metallic, transparent; 2-7 mm thick. Rolls 15"-48" (w) × 5, 10, 50 yards (l).	Cast formulation mixed/poured onto a sheet and moved through a series of ovens. Calendered: No solvents. "Dough" is extruded/squeezed between rollers.	Can be printed or cut by hand or CNC machine, and applied to most surfaces. Comes with backing paper.	Interior or exterior	Medium	Letters, logos, shapes, large surfaces, windows (forward or backward) back lit surfaces
	Additives such as colors, UV absorbers, stabilizers, fillers. ^a Single adhesive surface. Comes without adhesive.		Medium (exterior use)						
B. Ink/paint #1 ^c (Solvent-based)	Various petroleum-based vehicles.	High	Long term	Matte to glossy, depending on additives. Unlimited colors.	Solvents, dyes, pigments, resins, lubricants, etc. ^c	Most surfaces porous or nonporous. Dries fast. Cures slowly.	Interior or exterior	Medium to high depending on additives	Apply images/text to almost any surface. ^c High-color brilliance. Toxic fumes and nonbiodegradable.
	Pigments. High VOC, 4-butyrolactocyclohexanone.								
C. Ink/paint #2 (Low-solvent based)	Diethylene glycol. Diethyl ether.	High	Long term	Matte to glossy, depending on additives. Unlimited colors.	Solvents, dyes, pigments, resins, lubricants, etc. ^c	Most porous surfaces. Dries fast.	Interior or sometimes exterior	Low	Apply images/text to almost any surface. High-color brilliance. Low-toxic fumes. Nonbiodegradable.
	Tetraethylene glycol. Pigments. Medium to low VOC								
D. Ink/paint #3 (oil-based)	Mineral oil. Pigments.	Medium to low	Medium (interior use). Low (exterior use)	Matte to glossy, depend on additives. Unlimited colors; Cartridge or bulk.	Mineral oil, dyes, pigments, etc. Lengthens print-head life.	Most porous surfaces. ^c Dries fast. Cures fast.	Interior or sometimes exterior	Low	Apply images/text to almost any surface. High-color brilliance. Low-toxic fumes. Nonbiodegradable
E Ink/paint #4 (water-based). [Aqueous]	Latex/acetylene glycol/pigment. [Ethylene oxide surfactant/wetting agent/penetrating agent/pigment/water]	Low	Long term (interior use). Short term (exterior use).	Matte to glossy, depending on additives. Unlimited colors; Cartridge or bulk. Dyes, pigments, etc. Sometimes drying inhibitors.	Water solvent	Most porous surfaces. ^c Dries fast.	Interior or sometimes exterior	Low	Paper surfaces. Nontoxic fumes. Nonbiodegradable.

(Continued)

Table 1 Most commonly used sign materials. (Continued)

Category/ brand	Material contents	Strength	Durability	Look/sizes	Formation process	Compatible materials	Installation locations	Relative cost	Uses
F. Ink/paint #5 (Eco- solvent based)	Various vegetable solvents: soy, corn. Binders: Cotton wood pulp.	Medium to low	Long term (interior use), short term (exterior use)	Matte Unlimited color. High- color brilliance.	Lighter solvent. Less pigment needed.	Most porous surfaces. Dries slower.	Interior or sometimes exterior	High initially but low ultimately	Apply to most porous materials. Nontoxic. Mostly biodegradable.
Non-electric changeable signs^a									
Category/ brand	Material contents	Flexibility	Look/sizes	Formation process	Compatible materials	Installation locations	Relative cost ^d	Uses	
A. "Menu Boards"	Frame of plastic, wood, bronze, or aluminum. Grooved felt board. Plastic letters inserted into the grooves with pegs on back.	Individual letters inserted in felt grooves form lines of words. Some lighted. Some covered with acrylic. Some boards switch with cork boards.	Frame colors by material. 12" × 18"-96" × 48". Felt in several colors. Letters black/white. 5/ 16"-2" height. Wall mounts. 1 or 2 pedestal styles.	Extruded metal/ plastic frame. Rigid felt board in frame. Molded acrylic letters.	Symbols, arrows available with letters.	Interior. Exterior with cover or under shelter	Low	Churches, schools, restaurants, any place with constantly changing messages on signs.	
B. "Slider" add-ons	Frames of aluminum, bronze, wood/PVC, acrylic, etc. Text strips of acrylic, paper, vinyl, metal.	Text strips slide into channels from the side. Some covered. Some lighted.	Frame colors by material. Standard/custom sizes. Text strips in standard/ custom sizes/ colors/typesyles/ materials.	Extruded metal/ plastic frames. Text strip channels integral with frame or inserted in frame. Text strips printed, routed, etched depending on material	Larger custom panels available: maps, graphics, phrases, logos.	Interior. Exterior with cover or under shelter	Medium to high depending on material	Directories, room door, or function identifiers. Any place needing semipermanent text/ graphics, or an expanding list. Some include Braille. Some permanent.	
C. "Face" add-ons	Frames/ panels of bronze, wood, PVC, metals, acrylic, etc. Attachments of various	Attachments onto backing by clips, clip channels, magnets, screws, pressure, velcro, glue.	Frame/panel colors by materials. Standard/custom sizes/shapes. Attachments in standard/custom sizes/colors/	Extruded frames. Panels manufactured by material. Attachment strips extruded/cast. Other shapes manufactured by	Larger custom panels available: maps, graphics, phrases, logos.	Interior. Exterior with cover or under shelter	Medium to high depending on material.	Directories, room door, or function identifiers. Any place needing semipermanent text/ graphics, or an expanding list. Some include Braille. Donor	

	<u>woods</u> , <u>plastics</u> , <u>metals cast</u> <u>stone</u> , depending on use.	Some covered. Some lighted.	typetypes. Shapes: strips or standard/ custom ovals, rectangles, tree "leaves," etc.	material, printed, routed, etched, etc.			recognition. Some permanent.
D. Pedestal frames: "A" frame with wheels. [Dry- erase.] Chalkboard. { Snap frame } Channel frames	Frames of <u>chrome</u> , <u>bronze</u> , acrylic, <u>wood</u> , baked enamel <u>steel</u> , depending on style. Inserts are <u>paper</u> , any printable poster/ information material, depending on use. [Melamine, polyester coated steel, enameled steel (magnetic)]. Some with felt boards.	Frames take a poster or board for temporary use. Poster slides in a channel or { frame "snaps" apart/together } Boards in frame take [makers], chalk, press-in letters in felt. Some covered. "A" frame is 2- sided easel.	Frame/pedestal colors by material. 1 or 2 pedestals. Some clamp/slat-wall/ magnetized. Frames take various sizes rectangles, [precut arrow]. Frame atop pedestal. Straight pedestal. Straight letters in felt. 60" h. Clamp, slat-wall, magnetized. Table styles are 8"-11" h.	Extruded frames/ pedestal posts. Some frames molded. Wood/ pedestal bases/ other styles manufactured according to material/use.	Posters in slots can be of any material that fits, contain any message.	Interior mostly. Plastic styles exterior.	{ Low } to high depending on materials/styles/sizes. Any installation needing temporary to semipermanent information free- standing and/or movable. Some clamp to shelf/ table.

For a more complete table of sign materials, see <http://www.mapsandwayfinding.com>; Underlined and Italic text denotes environmentally responsible processes or recyclable materials, in whole or in part.

ADA, Americans with Disabilities Act; FSC, Forest Stewardship Council; CNC, Computer Numerical Control; VOC, Volatile Organic Compound.

^a Specifications are for most commonly available materials.

^b Must be able to fit substrate through printer.

^c All printing inks and paints must be matched with appropriate substrates for compatibility.

^d Compared with other changeable sign types.

Table 2 Outcomes an institution can expect from a successful wayfinding and signage program.

- A. Compliance with local, state, and federal regulations.
- B. Removal of physical and cognitive barriers for all visitors.
- C. Enhancement of visitability.
- D. Benefits for visitors, staff, volunteers, and suppliers of goods and services.
- E. Savings of staff time and money.
- F. Clarity and focus of brand recognition.
- G. Improvement of "good neighbor" standing.
- H. Recognition by the community, colleagues, and industry organizations.
- I. Contributions to environmental efforts.
- J. Upturn in visitors' word-of-mouth enthusiasm.
- K. Opportunities for new visitor niche markets.
- L. Options for new advertising directions.
- M. Increase in revenue.

had been supplanted more typically by shingle signs. Second, the images had become more sophisticated and specialized, not only depicting services within, but in the case of inns and taverns, displaying images or icons designed to attract specific groups of travelers. Thus a cross might be used to attract the Christian traveler, a star or moon used for the pagan, or a sword advertising a place catering to a military traveler.^[54]

By the end of the fourteenth century, every conceivable type of wayfinding signage in existence today was already in place. The primary difference between then and now was in sophistication, use of electricity, and ever-increases in size.

During the seventeenth century German Inns displayed heraldic symbols by their front doors as testimony to their acceptability to visiting nobles. As with the modern custom of displaying a window full of chamber of commerce, Triple A, or assorted endorsement stickers, the more symbols displayed, the better the establishment.^[55] This technique was a boon to both the travelers and the inns.

Types of Signs and Materials

General types or functions

Wayfinding signage can be classified in five major message groups.

1. Directional. Point the way to a location or function. They usually contain a combination of an arrow and text or symbol.
2. Identification. Name a location or a facility at a location. Street addresses and names of buildings are examples.

Fig. 10 An interpretive sign made of an imbedded thermosetting resin on aluminum post legs. Westerly Land Trust, Westerly, Rhode Island.
Source: Design and photograph by the author.

3. Information. Explain, describe, or list data for a location. Building directories, hours, or stationery maps are examples.
4. Regulatory. Communicate special uses or instructions. “Do Not Enter” or “Private” are examples.
5. Warning. Communicates a danger or hazard. “Watch out for poison ivy” or “Danger, High Voltage” are examples.^[56]

Specific types

The following are more specific types of signs listed by installation styles, uses, and materials used for signs and content. There are hundreds of materials used in the sign industry, each formulated for its most appropriate use in regard to strength, durability, look, formation processes,

compatibility with other materials, installation location, intended audience, and cost.

Fixed content signs. These are “carrying” surfaces, called substrates, with accompanying content that do not change once they are manufactured. Some are meant to be temporary, others are not meant to be removed or replaced easily. These can be single installations or separate letters on a surface, and lighted in a variety of ways, including from inside the sign or letters.

1. Temporary signs can be posters, banners, or signs usually made with less expensive materials.
2. Permanent signs can be installed indoors or outdoors, and include street signs, building identification, room and restroom signs, most vehicle graphics, most You-Are-Here information, and advertising. These signs

Fig. 11 Changeable electric sign: a pedestrian crossing light with speakers installed on top to send audible signals to people who are blind, Albany, New York. Streetlights, crosswalk lines, curb cuts, under-foot texture changes, open vistas, and important building landmarks are also wayfinding elements.

can be walls with painted or attached content, panels attached to a wall or hanging from it at 90°, “shingle” style, free standing panels in frames, or on poles, “A” frame stands with panels and content on both sides. See Figs. 8–10.

Changeable content signs. These signs can have permanently attached or portable substrate, with changeable or programmable content. Uses include announcement boards, warnings or advisories, identification of temporary locations, crowd control, interpretation information, or advertising.

1. Nonelectric types have letters or lines of text, images, etc., that can be applied and changed mechanically. The most common examples are menu boards and directories.
2. Electric styles have content that can be changed by electric and/or digital means. They can range in size and use from huge animated outdoor advertising to handheld interactive computers.

See Figs. 11 and 12 for two types of changeable signs.

CONCLUSION

Wayfinding and signs have been a part of Western culture for thousands of years, coming to a developed level during the height of the Roman Empire, by which time all today’s basic types of wayfinding elements, maps, and signage had come into being. Today, the materials involved in wayfinding have gotten more sophisticated, immediate, and interactive, owing to a long history of advances in concepts, principals, and materials.

The charge of wayfinding is that people of all types and abilities be afforded the chance to move around freely and find what they need wherever they go with a minimum of confusion or barriers. There is a vast discipline of professionals, and an impressive number of materials and processes available to insure that this charge is accomplished as often as possible in an attractive, straightforward, and environmentally sound fashion.

Human behavior, thought processes, design principals, positive attributes of elements, people, and categories of uses and materials all contribute to the creative mix known as wayfinding and signage.

ACKNOWLEDGMENTS

Authors, specialists, and resources cited in this entry were very generous with their experience and insights. I would like to thank my wife, Deborah M. O’Brien for her assistance and patience during the writing. As helpful as these people have been, no one but the author is responsible for the contents.

Web Scale Discovery Services

Jason Vaughan

Library Technologies, University of Nevada, Las Vegas University Libraries, Las Vegas, Nevada, U.S.A

Abstract

Web scale discovery services facilitate a streamlined discovery and delivery environment for end users. These services began gaining traction in the library marketplace around 2010, as multiple services from various vendors entered general release into general release. These services consist of a modern web interface used to search and retrieve results from a large preaggregated and optimized central index hosted and maintained by a discovery service vendor. Compared to earlier library search tools, web scale discovery services offer a single search box approach, with queries returning results to a much greater level of granularity than the traditional library online public access catalog (OPAC) (such as returning results indexed at the individual article level). Web scale discovery services search a greater pool of content, sourced from both local library repositories (e.g., OPAC holdings, digital collection holdings) and remotely licensed sources (e.g., publisher or aggregator provided electronic journal content). Web scale discovery services can be compared to an earlier predecessor, “federated search.” A primary differentiator with web scale discovery resides in the fact that a pre aggregated and optimized central index is searched, as opposed to a real-time search of multiple, disparate targets. Compared to earlier library search technologies, web scale discovery services offer the promise of quickly returning results at a granular level, typically ranked by relevancy. Web scale discovery services are at an early stage of development, with some noted concerns, which may be addressed in the future as the product space matures.

INTRODUCTION AND DEFINITION

Compared to earlier search and retrieval tools, web scale discovery services offer a more expansive and responsive search across library owned and licensed content. Relative to older technologies such as the library OPAC (online public access catalog), web scale discovery services are in an earlier stage of maturation. This entry seeks to provide a definition, note several precursor search technologies, and briefly discuss the interface, content, and technical infrastructure typically associated with this services. The conclusion provides a brief mention of some current noted challenges, initiatives, and potential future developments.

“Web scale,” as noted by Breeding, can be characterized as “Large-scale technology platforms; applications delivered through multitenant software as a service; massively aggregated approaches to data; highly cooperative arrangements among participating libraries.”^[1] Web scale discovery services can be considered a growing and important component of the library information management/discovery/delivery ecosystem. As noted by Hoepfner, web scale discovery can be considered “a preharvested central index coupled with a richly featured discovery layer that provides a single search across a library’s local, open access, and subscription collections.”^[2] The National Federation of Advanced Information Services (NFAIS) notes,

“A Discovery Service can be broadly defined as a link between the information User and the Platform on or

location at which the information resides . . . a Discovery Service is defined as one that provides a ‘single search box’ to access a central index of pre-indexed metadata and/or full text. The content that is pre-indexed is harvested from both remotely and locally held repositories to create a searchable broad central index of robust metadata. This is done via agreements with Content Owners who may license access to their metadata and/or full text for indexing purposes directly or through a Content Aggregator, via access to open collections and repositories, and via agreements to access local library resources and special collections. The central index allows for rapid search and retrieval of information resources to which a library has right of access within their own holdings or through shared/open resources and interlibrary loan and is integral to the discovery service infrastructure.”^[3]

As noted by Vaughan,^[4] “Web scale discovery can be considered a service capable of searching across a vast range of preharvested and indexed content quickly and seamlessly.” Components typically include a cloud hosted search service (allowing the end user to perform searches against indexed content stored a large, centralized, pre-indexed database of metadata encompassing a variety of local and remote content. “Web scale” can connote the size of the index and expansiveness of search. Development and adoption of web scale discovery services involve several chief stakeholders, including libraries and their users, content providers, and vendors creating, hosting, and evolving the interface and indexing infrastructure for

the services. Web scale discovery services include a technological component (front-end search interface, back-end index) and a content component (metadata and/or full text associated with local holdings and remotely licensed content). Together, a modern user interface provides a mechanism to initiate a search against a unified, pre-aggregated index, with results returned at a more precise, granular level than previously realized with earlier library tailored discovery tools.

Web-scale discovery services have involved arrangements encompassing multiple, and sometimes overlapping, stakeholders. As noted by NFAIS, there are multiple participants at some level or another associated with the provisioning and utilization of web-scale discovery services. These include the original content owner, the platform hosting the content, the discovery service itself, the discovery service subscriber (such as an academic library) and the user (such as a faculty member or student).

PRECEDENTS AND HISTORY

In the networked library environment, precedents of web scale discovery services include the OPAC and federated search discovery tools. The OPAC, with development dating back to the late 1970s and which ultimately largely replaced hardcopy card catalogs services, provides an electronic interface enabling search and retrieval functions against a database of content normally tied to a local library's collection and normally indexed to the bibliographic / item level of granularity (e.g., monographs, e-books, etc., but not, for example, individual journal articles). OPACs gradually evolved from a text-based to a graphical user interface accessible via a web browser, and eventually allowed for inclusion of hyperlinks to hosted content beyond the local library. Later, "next-generation" OPACs, introduced in the early twenty-first century (and still in use by some libraries at present), added additional features such as faceted searching (allowing users to narrow down an initial retrieved list of results on factors such as publication date, material type, etc.) and the ability to include harvested content from other, usually local, repositories (e.g., such as content found in asset management systems or other institutional repositories). The OPAC traditionally included only local content, and typically only fielded metadata was searched (though, as products evolved, search capabilities grew to include advanced keyword searching, and search of richer content such as tables of contents).

Beginning in the 1990s, the advent and growth of remotely hosted, often subscription based electronic databases (providing abstracting and indexing information, and, in some instances, native full text) contributed toward what became known as a "siloeed" information environment. A large number of search interfaces and content pools associated with a multitude of databases and online journals contributed toward a disjointed discovery

environment. Adequate awareness, skill, and time were necessary to perform comprehensive and encompassing information searches. Federated search tools, first debuting in the late 1990s, provided a web-based single search box, and represented an early attempt to ease the fragmented search environment. Users typed in their search term(s), which were then broadcast simultaneously in real time to preconfigured targets (resources searched). This often included both local targets, such as the OPAC index, and remotely hosted targets, such as abstracting and indexing (A&I) and/or full-text databases of remotely hosted content licensed by the library. As such, federated search provided access to a larger set of content than usually contained in an OPAC alone. Frequently noted limitations of federated search included slow performance, poor presentation of returned results, challenges in deduplication of results, and providing effective relevancy ranking across the set of returned results (e.g., such as the tendency to provide results from the first, not necessarily best, remote database to respond to the search query).

Google Scholar, a search tool debuting in 2004 from Google, Inc., has many features similar to web scale discovery services developed later, specifically tailored toward the library environment. Google Scholar provides a web-based search interface, returning ranked results from a pre-aggregated index of content including journal articles, books, and other content types. Content within the index can include repositories outside the library (e.g., academic publishers, etc.), and, through leveraging additional services (via local library link resolvers and OCLC's Open WorldCat service), can optionally provide greater end-user awareness of local library content. Google Scholar differed from earlier federated search tools by having a pre-aggregated index, capable of quickly returning results ranked by relevancy.

In the library environment, use of the label "web scale discovery services" often refers to the commercial products debuting around late 2007, specifically tailored toward the library environment. These products are normally marketed as "services," given that there is ongoing work by the vendor (interface development content additions to the index, etc.), and, consequently, an annual service cost to libraries subscribing to the service. Examples of current services include OCLC WorldCat Local (introduced in 2007), Serials Solutions Summon (2009), Ebsco Discovery Service (2010), and Ex Libris Primo Central (2010). Visioned as a whole, the evolution of these services signifies an evolving end user search environment, from an earlier one often geared toward known-item search, to one which has a larger serendipitous, interdisciplinary discovery aspect.

CHARACTERISTICS: CONTENT

Relative to earlier indexes associated with library content, indexes associated with web scale discovery services are

large in size and broad in depth of included content types. Depending on vendor, the reported size of individual records associated with web scale discovery indexes range from hundreds of millions of item to over one billion. Items are indexed to a more granular level than traditional OPAC systems, a level such as individual journal articles, discrete photographic images within a digital collection, etc. Content can include both locally hosted content as well as remotely hosted/licensed content which is often matched against licensed / paid content subscribed to by the library, from a variety of. Content, regardless of source, is typically ingested into a large, centralized prebuilt and normalized index. Typical examples of locally hosted content can include records associated with locally held books, digital collections, and other materials found in institutional repositories. Examples of remotely hosted content types include scholarly journal articles, consumer magazine articles, newspapers, conference proceedings, abstract and index records, and electronic books. Leveraging a discovery and delivery ecosystem also comprised of technologies such as knowledgebases and link resolvers, the Such content can include licensed/paid content (matched against library subscriptions in the overall discovery and delivery ecosystem)) as well as free, open access content. For indexing purposes, content providers may provide item fulltext, standard fielded metadata (title, author, publication date, etc.), and/or value-added metadata (such as keywords, abstracts, subject headings). External content providers can include the original primary publisher of the content, producers of abstracting and indexing data, and other content aggregators. A chief way library-tailored web scale discovery services differ from a general web search engine is that the index is comprised of content that could be considered at least somewhat vetted by the library, in the sense it's comprised of content with some level of collection oversight—content which is often owned, licensed, or otherwise at least minimally selected by the library.

CHARACTERISTICS: INTERFACE AND TECHNICAL INFRASTRUCTURE

Web scale discovery services are accessed via a web browser and include features, which, in the library environment, were often initially introduced in late-generation library OPACs. This includes a (default) single search box (alleviating the need to choose a specific index such as author, title, etc.), with an option for a more tailored, often fielded search via an advanced search option. The interface includes faceted search, allowing users to refine a set of returned results on parameters such as publication date range, material type, or location (dependent on the particular vendor). Richer evaluative record content may be included, such as monograph cover images, reviews, and summaries, and web 2.0 social community reviews or

recommender services. Other elements include “did you mean,” type prediction, spell checking, rich export, and automated citation management functionality. By default, results are normally returned ranked by relevancy, determined by factors such as publication date, appearance of the search term in particular metadata fields, and proximity of search terms relative to each other. Alternate presentation orders can be selected, such as most recently published items first. Compared to predecessors such as earlier OPACs and legacy federated search tools, and facilitated by central hosted by the vendor, enhancements for web scale discovery services normally follow a rapid development cycle, which can include rapidly expanding indexes and evolving interfaces.

Content metadata associated with a discovery service's centralized index can be sourced (harvested) from many providers, both locally and remotely hosted. Metadata associated with this content is typically normalized to the discovery vendor's particular record schema. The centralized index may grow over time as new content is ingested and incorporated into the index. This approach differs to earlier federated search tools, which searched multiple dispersed indexes (often with different record schemas) in real time. In the case of more modern web scale discovery services, the user searches a massive, uniform, single index, allowing for results returned more rapidly. This approach also facilitates the return of results ranked according to the discovery service's algorithm (or sorted, often at the end-user's discretion, by parameters such as newest items first. Depending on the particular vendor's implementation, records of the same discrete item sourced from different providers (e.g. a particular journal article) received from different content may be deduped or merged into a single record.

In the content delivery ecosystem, web scale discovery services typically utilize an OpenURL link resolver to facilitate resolution to the final item a user hopes to retrieve (e.g., such as a fulltext article hosted by the original publisher). Vendors may provide APIs allowing local customers to enhance or develop alternate search and retrieval interfaces that still search the centralized hosted index.

The discovery index and search interface are typically hosted by the discovery service vendor, in a software as a service (SaaS) context, in a cloud-based infrastructure. Competing web scale discovery services vary in the degree their search services are curtailed or restricted for nonauthenticated users; in some products, the full index may not be open for search (let alone full content retrieval/view) for unauthenticated users. Web scale discovery services may tailor or scope results to each individual library customer, with the goal that returned results match subscription holdings, locally hosted content, and open access content, all materials which the library user should have legitimate access to. In some services, the index may be open to search by the local library user as well as those not

affiliated with that particular library (i.e., all users can search, but authorization credentials may be requested at the time they tried to retrieve the licensed full text).

Discovery services may make underlying service calls to other repositories for real-time information (such as availability status for a monograph owned by the library, or to place a hold on a locally owned item). To present the final resolution content, such as a full-text journal article, the user may be taken out of the immediate discovery service context, (e.g. such as taken to a different website through a new browser window or tab). Given the number of different associated components in the information discovery and delivery ecosystem, some components of which may come from disparate vendors, there exists the chance of failure in the user seamlessly retrieving the full content associated with an item.

As noted above, web scale discovery services are normally marketed as a subscription service, with the maintenance, hosting, development, and backup handled by the vendor.

Responsibilities of the local library can include initial metadata field mapping of local content to the vendor's record schema, as well as sending local repository record loads to the vendor (e.g., such as bibliographic records from the library's local catalog). This can include an initial load to initiate the service with local materials, and incremental loads that reflect local content additions, deletions, or changes. The local library may also have some capacity to determine if certain interface features are activated and available in their instance for their particular end user clientele.

INITIAL CHALLENGES/AREAS OF FUTURE DEVELOPMENT

Web scale discovery services for libraries are at maturing but still relatively an early stage of development, and some initial challenges have been evidenced. Some of these are reflective of the complex array of stakeholders involved in the provisioning and usage of web scale discovery services. Content providers, content aggregators, and librarians each have unique concerns and perspectives, and interests they wish to advocate and emphasize. A chief issue is librarians' contention that discovery service vendors have lacked transparency in stating precisely what content is included in the searchable index, which in turn makes it difficult to educate end users as to whether a particular set of content (e.g., a particular journal title important to their discipline or research interest) is included. Content coverage comparisons between current vendor services are hard to conduct. Size of index is only one consideration in comparing products, and, while index size was an early differentiator among products, this has lessened over time as each major index now contains a large amount of content. Some vendors can conduct at

least a partial content overlap analysis (e.g., for serial titles held/subscribed to by the library) to help the library determine what portion of their content is included and indexed by their discovery tool.

Another observed challenge relates to how content is indexed. As noted above, different vendors, for the exact same item, may index a different amount of associated data related to that precise item. In building their service's index, vendors may have one data source for a particular item, or multiple data sources. Source data may include a citation, an abstract, the full text, particular metadata fields, or a combination. The vendors may themselves provide additional enhancement services against the metadata after receipt by the original content provider, such as the addition of subject headings. Such distinctions are important, in that the depth of indexing for an item can positively or negatively impact the relevancy of returned results for a search. This becomes increasingly significant when considering the sheer size of the index being searched, as relevancy can be harder to tune as an index grows in size. In the future, vendors may look to incorporate additional factors to help determine relevancy, such as better understanding the user's context, research interests, or previous search queries.

Another challenge revolves around the concept of vendor neutrality. Several discovery service vendors are associated with parent companies whose other responsibilities include native content provisioning. Concerns have been raised by librarians (and competing vendors) that this could compromise the ability to remain content provider neutral (i.e., the possibility exists to promote content from the service's parent company above content sourced from other providers). Similarly, concerns have been raised that some vendors may be entering into exclusive agreements with some publishers, hindering such content from being included in the indexes of other services.

A NFAIS report mentions additional challenges, such as diminishment of content owner or aggregator brand awareness, potentially negative alterations in usage patterns / counts experienced by content providers, and a lack of transparency related to search algorithms used to determine relevancy.

Web scale discovery services provide a more streamlined discovery and delivery environment than earlier tools. While the single search box and optimizations in full text delivery have perceived advantages (the search experience is more "Google-like"), it also represents change for librarians in how they inform, educate, and provide assistance to library end users seeking information. As they presently exist, web-scale discovery services may be ideally suited to a particular user or particular type of research need. Efforts may be needed to educate users that library web scale discovery services do not include ALL content, acknowledging that other resources, depending on the research need, may still need to be consulted should a user wish to conduct a truly

comprehensive search. This can be challenging as it competes against a “need-it-now” search environment, with many users looking for easy, rapid returns for a search query. Similarly, some content by its specialized nature may be better attuned to different indexing schema or presentation of results, and such search and retrieval flexibility may not exist with a standard web scale discovery index or interface.

Two significant initiatives which worked to synthesize and provide recommendations for some observed concerns related to web scale discovery services included one sponsored by NISO and another sponsored by NFAIS. NISO established an Open Discovery Initiative, which released a recommended practice entitled “Open Discovery Initiative: Promoting Transparency in Discovery” (NISO, Open Discovery Initiative: Promoting Transparency in Discovery. 2014; <http://www.niso.org/workrooms/odi/publications/rp/rp-19-2014> [accessed August 8, 2017]). NFAIS released a report entitled “Recommended Practices: Discovery Services” (NFAIS, Recommended Practices: Discovery Services. 2013; https://nfais.memberclicks.net/assets/docs/BestPractices/recommended_practices_final_aug_2013.pdf [accessed August 8, 2017]). These initiatives sought to synthesize and provide recommendations related to several observed concerns associated to web scale discovery services.

CONCLUSION

Libraries are increasingly adopting web scale discovery services, as vendor offerings mature and libraries dedicate budgets toward web scale discovery service subscriptions. Searching across a wide body of scholarly content has been a goal for libraries for some time, as evidenced by the earlier development of the Z39.50 protocol and the later advent of traditional, first-generation federated search products. The centralized pre-indexed database

associated with modern web scale discovery services mitigates several noted problems of earlier search technologies and offers a more streamlined discovery and delivery environment for a significant cross section of end users.

Various avenues of potential development may be pursued in the future, perhaps to help address challenges noted above. Several discovery service vendors have released modern “library services platforms,” targeted to replace the traditional “integrated library system,” utilizing new information architectures geared toward more efficient management of electronic content and based on a more open data foundation. In the future, discovery services associated with a particular vendor may increasingly be integrated into the particular library service platform offered by the same vendor. Relevancy ranking will continue to be honed and discovery services may become more aware of “where the user is,” perhaps evidenced by deeper integration in social media as well as greater responsiveness or dedicated applications (e.g. mobile access). As discovery services evolve, the traditional discovery portal of libraries, the OPAC, will increasingly be relegated to a shrinking, supporting role in the discovery ecosystem.

Webometrics

Mike Thelwall

School of Computing and Information Technology, University of Wolverhampton, Wolverhampton, U.K.

Abstract

Webometrics is an information science field concerned with measuring aspects of the World Wide Web (WWW) for a variety of information science research goals. It came into existence about five years after the Web was formed and has since grown to become a significant aspect of information science, at least in terms of published research. Although some webometrics research has focused on the structure or evolution of the Web itself or the performance of commercial search engines, most has used data from the Web to shed light on information provision or online communication in various contexts. Most prominently, techniques have been developed to track, map, and assess Web-based informal scholarly communication, for example, in terms of the hyperlinks between academic Web sites or the online impact of digital repositories. In addition, a range of nonacademic issues and groups of Web users have also been analyzed.

INTRODUCTION

Webometrics, which has been described as one of the dominating forces in library and information science research at the start of the twenty-first century,^[1] is “the study of the quantitative aspects of the construction and use of information resources, structures, and technologies on the WWW drawing on bibliometric and informetric approaches.”^[2] This definition emphasizes a heritage in the information science field of informetrics, in addition to the scope of studies (the Web) and their methodological orientation (quantitative). Webometrics is sometimes given other interpretations; the widest is simply quantitative studies of Web-related information—which is similar to computer science Web metrics/dynamics.^[3,4] A closely related term is cybermetrics, which is quantitative research into all aspects of the Internet, including e-mail and network traffic. Much information science webometrics research has been concerned with link analysis or search engine evaluation. In fact, individual researchers and articles have often investigated both because search engines have often been used to gather raw data for link analysis. Other webometrics topics include online citation analysis, analysis of the online profiles of individuals, longitudinal studies of Web change, and investigations of the online spread of issues. After an overview of the history of webometrics, an introduction will be given to the main topic areas.

HISTORY

The term webometrics was coined in an early article of Almind and Ingwersen,^[5] and by the end of 1997 a number

of quantitative Web studies had been published, some by information scientists. One prominent study was Ray Larson’s conference paper: *Bibliometrics of the World Wide Web: An Exploratory Analysis of the Intellectual Structure of Cyberspace*. The idea of using Web page hyperlinks to extract relationships from the Web emerged within information science at this time, in parallel with the invention of the influential link ranking algorithm PageRank for Google, which had its intellectual roots in bibliometrics.^[6]

The first information scientist to publish a discussion of the potential for transferring information science techniques to the Internet was the Brazilian Marcia J. Bossy,^[7] with an article in a French online and print journal. Larson^[8] published the earliest “bibliometrics of the Web” study of real data, seeking link-based methods for identifying topic organization on the Web. Rodriguez i Garin^[9] and Almind and Ingwersen^[5] simultaneously identified the ability of advanced search engine interfaces to deliver powerful statistics about Web pages and links. At the time AltaVista was the most potent instrument for this kind of research. Rousseau^[10] took a more mathematical approach, identifying Zipf’s law on the Web and predating the later more famous statistical physics discoveries of power laws in the Web. Essentially, a power law indicates a highly skewed distribution. For example, a few Web pages attract an enormous number of links whereas most Web pages attract only a few. Another important milestone was Aguillo’s^[11] claim that new indicators for research and development could be constructed from the Web. This helped to trigger European funding for Web indicator research. In terms of meetings, webometrics has been most associated with scientometrics and has been well represented in all recent International Society for Scientometrics and Informetrics conferences.

The first webometrics journal special issue was published in a 2001 volume of the journal *Scientometrics*, with van Raan^[12] predicting—accurately so far—that the potential uses of the Web for research would not threaten the status of high quality peer-reviewed journals, and that traditional bibliometrics would therefore continue to be important. The special issue served as a warning for information scientists of the dangers of uncritical acceptance of Web data from search engines and of drawing unjustified conclusions from hyperlink data in particular.^[13,14] Subsequent research, reported below, including some in a 2004 *Journal of the American Society for Information Science and Technology* special issue, has shown that the problems identified are not insurmountable.

SCHOLARLY COMMUNICATION

Although there has been some webometric link analysis research on nonacademic domains,^[15] it has been in a minority so far, and so this review will be dominated by the academic link analysis tradition. Much information science research into scholarly communication has focused on extracting information from documents, such as journal articles, produced by scholars. A natural question to ask about the Web, therefore, is whether academic Web pages could yield useful new information about scholarly communication. This has led to different lines of enquiry, for instance concerning e-journals or university Web sites. Most research has focused on hyperlinks as potential indicators of impact through analogies with citations.^[16,17] Background information about the link structure of the Web can be found in two popular science books.^[18,19]

Journals

Journal articles form a key component of research in most disciplines and have traditionally been central to bibliometric research into scholarly communication. Journal impact factors, calculated by Thomson Reuters (formerly Thomson Scientific, and the Institute for Scientific Information or ISI), are influential estimates of the average impact of the articles published by a journal. They are the average number of citations that articles from a 2 years period (e.g., 2003–2004) receive from articles published the following year (e.g., 2005).^[20,21] The citations used in the calculation come from the documents (mainly academic journals) indexed by the ISI.

Webometric studies have calculated online versions of these impact factors by replacing citations with one of the following types of interdocument connection.

- Counts of hyperlinks to journal articles or whole journal Web sites.
- Counts of online citations, i.e., traditional citations in Web pages.

- Counts of citations of the URLs of online articles: “URL citations.”
- Counts of either of the two above: “Web/URL citations.”
- Counts of citations in Google Scholar or in online digital libraries.

Calculations are typically not time-constrained in the way that journal impact factors are. In other words, counts are performed irrespective of the age of the source or target document. A number of studies have assessed whether link calculations can give useful results. A standard technique has been to correlate ISI impact factors with online versions, looking for statistically significant similarities between them.^[22,23] Although early findings were inconclusive, later research did find significant correlations, as summarized below.

- Links to journal Web sites correlate with journal impact factors, provided that a single discipline is analyzed.^[24,25] Nevertheless, different fields show a different ratio of Web site inlinks to ISI citations, and factors that contribute to higher inlink counts for a journal Web site include the site age and the quantity of information hosted.^[26]
- Web citations, URL citations and Google Scholar citations of journal articles correlate significantly with print citations for most journals and across a range of science and social science disciplines.^[27–29]
- About 25–30% of Web citations of journal articles represent intellectual impact, and this figure is quite stable across a range of journals.^[28,30] There are typically more Web citations for a journal article than ISI citations.
- There are significant disciplinary differences in the extent to which articles are cited on the Web, at least for open access articles.^[29]

Despite the significant correlations found, a practical problem for using Web links/citations as a replacement for journal impact factors is that they can originate in large replicated or automatically generated pages. These include online library catalogs and journal publishers’ digital libraries. A promising approach, however, is the calculation of online statistics from large quality-controlled collections of articles online. Two examples are the CiteSeer computer science public Web library^[31,32] and arXiv.org, a self-publishing archive,^[33] but these currently represent field-specific possibilities.^[34]

Log Analysis of Journal Usage

Web log analysis is different from most webometrics because log file data is about the Web rather than being part of the Web itself. Nevertheless, research into the use of digital libraries is directly relevant to other

webometrics research into scholarly communication. Indeed, since log files can give direct evidence of the usage of articles, including some user demographics,^[35] and publishers like Elsevier now provide their editors with summary statistics about the number of online accesses of individual articles, it seems that this kind of data may significantly supplement or replace citations for evaluation purposes.^[36] The main drawback is that log file statistics are dependant upon the organization of the digital library Web site and some technical decisions about how to track users and so are not directly comparable, unless a standardization initiative can circumvent this problem. This is a sensitive issue since journals can be compared and ranked based upon usage statistics.^[37] In addition this data is of commercial value to the publishers and so may not be made available for research and evaluation without specific authorization.

An early Web log study used an individual open access online journal, *First Monday*, and defined “classic articles” as those that were downloaded most frequently.^[36] When analyzing individual open access journals, there is a need to “clean” the log files from automated download requests, such as from search engine crawlers. An early large-scale analysis of a publisher’s digital library was that of Elsevier in Taiwan, which was able to count instances of browsing and downloading journals and use them, amongst other things, to identify the most popular subjects and journals. Interestingly, the list of the top downloaded journals was significantly different from the top browsed journals and so future research should be careful not to use browsing statistics as a proxy for downloads.^[37] An investigation into open access publishing in arXiv.org found a significant but fairly moderate Pearson correlation between the natural logarithms of downloads and citations for articles in four different disciplines, including mathematics (0.347) and physics (0.462).^[38] In contrast, another approach is to combine citations to and “reads” of an author’s articles in order to produce a longitudinal profile of their changing pattern of influence.^[39]

People

Cronin et al.^[40] constructed a typology of online invocations of a small group of scholars. They used a search engine to find pages containing the scholar’s name and then classified the reason why the scholar was mentioned in the invoking page (if the invocation referred to the correct person). The most common type of page mentioning a professor’s name was online conference proceedings. An important finding was that the contexts of invocations on the Web were different from reasons for academic citation, and so the Web gave an opportunity for tracking “modes of communication” that were previously difficult or impossible to study.

Later research hypothesized that Web mentions might be used alongside other media mentions as indicators of

the fame of academics.^[41,42] It is not clear yet, however, how valid this approach is.

Universities

Can the overall impact of the research of an entire university be estimated by counting the number of links to its Web site? This is perhaps a strange question to ask since impact assessments are usually applied to individual scholars, research groups or departments, but rarely to entire universities. Nevertheless, this is a logical methodological question to assess whether links can be used for impact assessment. This is because entire university Web sites are sufficiently large, at least in developed nations, to give a degree of stability to link count statistics. The World Universities’ Ranking on the Web initiative (<http://www.webometrics.info>) is a high profile example of using links, in conjunction with other Web presence factors, to generate simple online indicators.^[43]

After much research into link counts as impact indicators for universities, some clear findings have emerged, albeit from investigations mainly restricted to the United Kingdom. University Web sites attract inlinks from other universities approximately in proportion to the research productivity of the owning university.^[44] University Web sites source outlinks on the same basis, and so the number of links between any pair of universities will be approximately proportional to product of their research productivities.^[45] The cause of more productive universities attracting more inlinks is not the increased impact of their pages, however, it is simply that they produce more pages.^[44] In the experiments deriving these results, straight link counting was found to be less effective than other forms that minimize the effect of large numbers of replicated links in Web sites.^[46] Longitudinal studies of static HTML pages have shown that the results of link analyses are relatively stable over time, and suggest that academic Webs in some countries have stabilized and ceased to experience exponential growth.^[47,48]

In addition to research productivity, geography is also a factor in linking: closer universities tend to interlink more.^[49] On an international scale, proximity and shared languages also seem to be important, despite English being extensively used on the university Web sites of non-English-speaking nations.^[50]

Research into departmental level interlinking has found results broadly consistent with those concerning university level interlinking. The outcomes of statistical tests of linking have been less significant, however, suggesting that departments have too few pages to give stable results. Nevertheless, departmental studies allow the investigation of linking by discipline, allowing comparisons to be made. As an example, U.S. departments of chemistry, history, and psychology have been compared:^[51] U.S. historians were found to hardly use the Web (but some historians do operate actively online),^[52] with chemists using it by far

the most and extensively interlinking. Other research has investigated library and information science^[53,54] and computer science,^[55] and physics, sociology, and math.^[56] One important (and rare) qualitative link investigation has shown how links can be valuable pointers to disciplinary differences and how qualitative interpretations can support the construction of effective frameworks for link analysis.^[57]

At the lower organizational level of research groups, some studies have sought to relate inlinks to home pages with off-line factors such as gender, collaboration networks, and research productivity within the life sciences. Of these, there was some evidence that female scientists and older scientists received less inlinks than others and, counterintuitively, the same was true for those with larger collaboration networks.^[58]

Link Creation Motivation

Although counts of links to university Web sites correlate significantly with university research productivity, this does not prove that a university's research causes others to link to its Web pages. Motivation studies have sought to find out if this is the case. In fact, relatively few links to university Web sites directly target research papers hosted in their general Web pages, only about 1%. There is a connection between research and link creation, but it is more indirect. About 90% of interuniversity links relate in some way to scholarly or educational activity,^[59] although a smaller percentage of these links relate more directly to scholarly or educational activity.^[60] This connection includes token links such as link to the home page of a collaborating researcher, or their department or university home page. Link counts, then, should be interpreted as reflecting a wide range of types of informal scholarly and educational communication. The importance of this statement is that inlink counts should not be used to assess the impact of a university's research. Nevertheless, a university that receives fewer links than should be expected for its research productivity should be concerned about whether its site is hindering its academics' online informal scholarly communication.

There is a problem with using a link classification exercise to attribute creation motivations to links in order to interpret link counts because different user groups (e.g., academic fields) can create links for different purposes.^[56] Subsequent research has reinforced the complexity of link creation motivations. Bar-Ilan introduced a multifaceted framework for classifying links that included the source page, linked area, the link itself, and the target page, using it for an extensive classification of links between Israeli academic institutions.^[60] The classifications included many categories and subcategories. Bar-Ilan's findings clashed to some extent with other research due to the problem of deciding which type of activities should be

classified as academic-related. There is also a classification problem in differentiating between educational and research-related links.

Other Academic Studies

Some research has addressed interesting questions that do not fall into the above categories, despite being quantitative, academic-related, and Web-related. A unique and promising line of investigation is Björneborn's^[61] small world analysis. He investigated the local structure of academic Web links, identifying chains of links between Web sites, particularly those that cross topic boundaries. This has the potential to give new insights into the kind of information that could be extracted from Web links, and why links are created.

Leydesdorff and Curran^[62] have used AltaVista to gather time series data for connections between university, industry, and government Web sites, comparing the Netherlands to Brazil. This research exploited AltaVista's recording of the "last modified by" date on Web pages, which allowed queries for old pages: those that had not been modified since the specified date. Such facilities are now provided in the Internet Archive in a more powerful form: allowing the retrieval of old pages even if they have subsequently changed. Also focusing on university–industry–government interconnections, Stuart^[63] used the case of the U.K. West Midlands Automobile Industry to show that citing practices differed greatly between the three sectors, with many collaborations not reflected on the Web in any way. A larger-scale study then found that the majority of intersector links did not reflect collaboration.^[64]

Online text-based evidence of connections between universities and business has been sought through an investigation of the occurrence of the names of academic journals in business Web sites.^[65] The results showed that this type of analysis was difficult because of pages that listed large numbers of journal names in the form of a list, without any real indication that individual journals were contributing knowledge to the hosting company.

Heimricks et al.^[66] have compared Web link patterns to citation and collaboration patterns. This multiple data source triangulation seems to be an effective way of exploiting Web data without relying exclusively upon it. This combining of different data sources to illuminate different aspects of the same situation is a promising direction for webometrics research.

Visualization

A minority of the academic Web link analysis articles have used visualizations to display the relationships between Web sites or organizations. Diagrams are a useful way to succinctly convey large link data sets. For example Heimricks and van den Besselaar^[67] used two-

dimensional multidimensional scaling maps to display clusters of interlinked Web sites,^[68] network diagrams to illustrate the strength of interlinking between the Web sites of various countries, and a colored hybrid cluster and link diagram to illustrate a combination of the two. A similar type of diagram has also been used to display the interlinking of national and technological sector differences within a single diagram.^[69]

NONACADEMIC LINK ANALYSIS

Vaughan has pioneered the application of information science link analysis to business Web sites. She has shown that colinks can be used to identify similar business organizations from the Web.^[70,71] In addition, a number of studies that have elements of quantitative Web analysis have origins outside of information science but are nevertheless relevant to webometrics. Three will be discussed briefly below, all concerning sociological analyses of specific phenomena.

Garridos and Halavais^[72] used hyperlinks between Web sites to illustrate and explore an online network connected to the Zapatista grass roots movement in Mexico. This gave insights into the range of different issues that were prominent amongst online activists, such as women's rights, and was also able to support a previously made assertion about the role that Zapatista support groups play in binding together a range of diverse types of nongovernmental organizations. This approach has been codified to some extent in a book of similar examples.^[73]

Web Sphere Analysis^[74] is an example of an integrated method for combining different information sources to study an online activity. This is described as "a 'mid-range' approach to making sense of linking practices, midway between close rhetorical/ethnographic analysis of links and large-scale link mapping." Hyperlinks are used, but only as one component of a wider Web analysis. For example, in an investigation into Web sites relating to the U.S. presidential election of 2002, no strong patterns emerged, leading to the suggestion that linking was still in an experimental phase in presidential elections, and than norms of activity had yet to be established. Related research has shown that there can be connections between off-line factors and Web presences for politicians^[75] and has discussed the use of a range of blog-related indicators to analyze online political campaigns.^[76]

The trend to integrate link analysis into a wider theoretical framework is a positive one, which could be increasingly successful if Web practices become more standardized and stable. The need to embed a study of Web links into other phenomena is exemplified by Hine's Virtual Methodology,^[77,78] which explores online activity through its organic relationship to off-line activities.

WEB 2.0

There have been many quantitative examinations of blogs and other Web 2.0 sites by computer scientists, webometricians, and the wider social science community. This section reviews those most relevant to webometrics.

A number of blog analyses have had computer science objectives but generated interesting results about the structure of blogspace. A temporal investigation into how topics are discussed within blogs showed that there were several common patterns: "mostly chatter," a steady volume of discussion; "spikey chatter," the constant discussion of a topic, like Microsoft, with occasional peaks caused by identifiable events; and "just spike," the sudden appearance of a topic and its subsequent eventual disappearance.^[79] The discovery of trends within blogs has received particular attention, with the development of a variety of algorithms to identify spikes or hot topics of discussion.^[80,81] In addition, there have been analyses of trends in discussion around particular events, such as the London Attacks,^[82,83] using a time series of the daily number of relevant blogs containing a particular word. This technique is able to reveal the frequency with which small topics occur within larger discussions. Interestingly, simple searches in free blog search engines, such as BlogPulse, can be used to gain retrospective insights into public discussions of topics,^[84] which is probably the first general-purpose source of retrospective public opinion.^[85]

Folksonomy is another aspect of Web 2.0 that has attracted quantitative research. A folksonomy is a set of user-generated tags for Web pages, images, videos, or other resources. The frequency distribution of tags within such a system is of interest for information retrieval purposes because the most frequent tags are necessarily the most general and hence it is desirable for a system to encourage users to use lower-frequency, more specific tags, even though some high-frequency tags may suit some user needs better.^[86] A specific study of university groups in the image sharing system Flickr found a tag distribution and types of tags which suggested that grouped images may tend to be more altruistically tagged.^[87] A more systematic study of tagging behavior (one of many about the issue) included informetric-style analysis of tags created by users and showed that habit was an important factor in explaining how users tag, but was not the only factor, with others including the influence of group norms.^[88]

One of the most innovative webometric studies is Voss's^[89] of Wikipedia, which showed that national Wiki growth tended to begin linearly but then to become exponential. Wikipedia links exhibit a classic power law, both for inlinks and outlinks, and the number of editors per article also follows a (broken) power law. Article sizes, in contrast, follow approximately a lognormal distribution with a distinct mean, probably reflecting attempts to

regulate article lengths. Another innovative approach is the History Flow visualization technique that is able to illustrate the editing history of Wikipedia articles.^[90] One finding was the existence of edit wars, during which the same changes were made and removed repeatedly over a period of time.

The Facebook social networking system is interesting for the insights that statistics can give into the way in which such systems can be used.^[91] Facebook started out as a college-oriented system and appears to have achieved almost universal usage amongst U.S. college students. A statistical analysis of usage patterns suggests that its use is primarily for communication between students at the same university, rather than for distant connections, and that its use was integrated into student's patterns of study rather than being a separate activity.^[91]

DATA COLLECTION

Most webometric studies rely upon data from commercial search engines, such as Google. Nevertheless, there are alternatives and methods of speeding up data collection. The main alternative is to use a Web crawler to download the pages from a set of Web sites and then analyze the results. Currently available free crawlers for research purposes include SocSciBot (<http://socscibot.wlv.ac.uk>) and Issue Crawler (<http://www.issuecrawler.net>). Data collection from search engines can also be automated using the Applications Programming Interface technology,^[92] and free online software for this includes LexiURL Searcher (lexiurl.wlv.ac.uk) and the Virtual Observatory for the Study of Online Networks (VOSON, voson.anu.edu.au).

EVALUATING SEARCH ENGINES

Early Web research discovered that the results returned by search engines were not reliable.^[93–95] The “hit counts” reported could change by orders of magnitude from one moment to the next. A key cause of this was the probabilistic nature of reporting algorithms. To save time, a search engine may query only a fraction of its database, estimating the total hit count with a probability calculation. Rousseau^[93] proposed that researchers should use the median of repeated queries in order to get more stable data. Mettrop and Nieuwenhuysen^[96] also analyzed search engines from a longitudinal perspective. They planted documents on the Web where search engines could find them and analyzed the results of search engine queries that should have returned the documents. They found that search engines behaved in an unpredictable way so that changes in search engine results did not necessarily reflect real changes in the Web. Further research into the hit count estimates returned by search engines has shown that they can include systematic biases: with low hit counts

reflecting a different kind of estimate to that of high hit counts.^[97] In addition, deliberate biases can be introduced into search engine results by organized groups.^[98,99]

It is important to set search engine research in the context of Web coverage. Search engines have been shown to crawl and index only a minority of the publicly available Web pages.^[100] Unfortunately for webometrics, however, and in addition to undesired fluctuations, this minority is biased by site age and country of origin, although not directly by language.^[101,102]

WEB EVOLUTION

Longitudinal or evolutionary studies take snapshots of the Web over a period of time and compare the results, looking for important trends. There are two types: those that study the results of search engines and those that monitor the Web directly.

An example of direct monitoring is the study of Koehler,^[103] who monitored a set of pages existing in 1996 on a weekly basis until February 2001, using a program to download and analyze the pages. The pages came from the random URL generator facility offered by a search engine of the time (WebCrawler). He found that pages of different types had very different longevities. For example, in commercial sites, navigational page type tended to be periodically updated, but content pages were more likely to remain unchanged for long periods of time. Interestingly, the opposite was true for academic pages: content pages were the more likely to be repeatedly updated. A trend for increasing stability over time was also found: an old collection of pages should experience less change than a young one.

Two large computing companies have combined to produce a very large scale, but short-lived, longitudinal study through direct crawling.^[104] The data set was 151 million pages, which were downloaded weekly for 11 weeks from December 2002 to February 2003. The experiment produced some interesting results, including: trivial changes to documents that did not affect their contents (e.g., HTML tag changes) were very frequent; and large documents changed more frequently than small documents. Less surprisingly, the amount of change in pages was significantly affected by the page's top level domain, and pages that changed frequently were likely to continue to change frequently.

A different type of longitudinal investigation is that of Bar-Ilan and Peritz,^[105] who studied the evolution of the results sets of search engines for queries for the word “Informetrics” from 1998 to 2003. They found that almost half of the pages in the results lists disappeared or changed between consecutive data gathering stages: 1998, 1999, 2002, and 2003. These results were in fact more stable than for general Web pages, which may indicate that

academic information tends to fluctuate less in search engines than other kinds.

Non-webometrics research has also conducted longitudinal studies in the sense of tracking the loss of information on the Web. For example, Veronin^[106] tracked the attrition-rate of health Web sites and Casserly and Byrd^[107] and Lawrence and Giles et al.^[108] analyzed the disappearance of URLs cited in academic papers. The latter studies touch a point that is fundamental to academia. If an article's cited resources disappear from the Web, does this undermine the credibility of its findings?

Finally, Web evolution has become an active research topic in computer science, under the name of Web dynamics.^[109] This research area typically uses mathematical modeling and large-scale experiments over the Web in order to derive results that would be useful aids to algorithm design, for example to help search engine ranking algorithms.

CONCLUSION

Webometrics has been reviewed, primarily focusing on link analysis and information science approaches relating to scholarly communication. Academic link analysis has perhaps not fulfilled early expectations of being an online counterpart for citation analysis because links are not created in the systematic way that citations can be, and are often not quality-controlled in any way. It is much more of an arbitrary decision whether an author chooses to add links to their page and, if so, which kinds of resources or pages to link to. Nevertheless, links can provide useful information if either the scale of a study is large enough to average out inconsistencies in link creation (i.e., whole universities) or links are used in combination with other sources to give a more nuanced overall picture. Recently webometrics has begun to embrace the increasing trend toward user content-creation with studies of blogs and other Web 2.0 phenomena, and has also seen webometrics-style research appearing in media studies, communication science, and politics. A second recent change is the use of text analysis to identify connections between Web sites or documents, even if they do not interlink. Future webometric research is likely to continue to extend link analysis techniques to more contexts outside of the academic arena, to react to new types of Web 2.0 spaces, and to focus on developing effective methods to visualize relationships between Web sites.

Word Processing: Early History [*ELIS Classic*]

Daniel Eisenberg

Florida State University, Tallahassee, Florida, U.S.A.

Abstract

This brief history of word processing hardware and software demonstrates that the ever-familiar word processing program of today had a more complicated and slowly-evolving history than might be expected.

—*ELIS Classic*, from 1992

DEFINITION

The term and concept of “word processing” are by now so widely used that most readers already are familiar with them. The term, created on the model of “data processing,” is more vague than commonly believed. A human editor, for example, obviously processes words, but is not what is meant by a “word processor.” A number of software programs process words in one way or another—a concordance or indexing program, for example—but are not understood to be word processing programs.

The term “word processor” means a facility that records keystrokes from a typewriter-like keyboard, and prints the output onto paper in a separate operation. In the meantime the words are stored, usually in memory or magnetic media. A word processor also can make improvements in the stream of words before they are printed. At their most basic these include the ability to arrange words into lines. An “editor,” such as the infamous EDLINE distributed with the Microsoft Disk Operating System (MS-DOS), lacks the ability to structure lines.

Commonly a word processor is understood to be a software program, and in the 1980s and 1990s it usually meant a program written for a microcomputer. However, preceding this period and continuing through it there have been hardware word processors. These are pieces of equipment sold for the sole purpose of word processing, containing in one package a keyboard, printer, recording and playback device, and in all recent examples a video or liquid crystal display screen. These machines include word processing software permanently stored in memory and processor chips, or in the earliest examples its equivalent in relays and wiring. A great disadvantage is that their storage media are usually incompatible with those of other machines, meaning words cannot be transferred from one system to another.

PREDECESSORS

The fundamental use of a word processor is to record, edit, and play back keystrokes. The printing press, whose

storage medium was lead type that had been “input” by the human or mechanical typesetter, itself carried out this function. While the press itself need not be especially bulky or expensive, the cost, weight, and complexity of the equipment and procedures needed to prepare the type for the press were great. Thus printing has rarely been found in offices, and has been relegated to a separate business, the printing shop.

Experiments in recording typewriter keystrokes, early in the twentieth century, used mechanical, air-driven mechanisms, borrowed from or inspired by the player piano. These were scarcely more than curiosities. The electric typewriter appeared in the 1930s, but despite its higher-quality output, it did not become dominant until two decades later. It seemed to offer the potential for more economical recording and reproduction of keystrokes, but it was not until the 1950s that a machine carrying out these functions was manufactured and sold in quantity: the Friden FlexoWriter. The FlexoWriter used punched paper tape as a storage medium, thus providing some compatibility with other data processing equipment.

Keystrokes could be deleted from the punched tape, which backed up as the backstroke key was pressed. The “delete” or nonprinting character consisted of all possible holes punched; this was later implemented in the ASCII character set, in which the highest character, 127, with all bits set, was a “delete” character. However, insertions could only be made by splicing the paper tape, and there was no means to turn carriage returns into spaces or vice-versa. The difficulty of revision made the noisy FlexoWriter impractical for routine office correspondence. Its main use was for what soon became known as the “form letter,” in today’s terminology a merge operation: a standard text with different names, addresses, or other data inserted. These were used for political purposes, fundraising, and sales.

THE MT/ST

The first true word processor, and IBM’s first entry into the field, was the Magnetic Tape Selectric Typewriter or MT/

ST, introduced about 1969. Much larger and more expensive than the FlexoWriter, the MT/ST included a model of IBM's workhorse Selectric Typewriter built into a small desk. Accompanying it was a console, about half as large as the desk, containing control relays, the tape recording and playback facility, and control buttons and dials.

As typing took place, keystrokes were recorded on 16-mm magnetic tape, using a head moved by solenoid and spring across the tape, one character per pass. The backspace key on the keyboard backed the tape up so the character could be overwritten with a new one. Cassette tapes of 100' held approximately 25K of data. A 7-bit data set was used, providing different codes for upper and lower case letters, and an increased set of control codes. In a technique borrowed from mainframe computers, the operator could mark the tape with electronic divider codes, called "Search Codes." While the concept of named files was still in the future, the machine counted the number of Search Codes on the tape and could thus search for a file. In a crude way it could thus assemble standard chunks of text into a composite output document.

The MT/ST incorporated a number of other innovations. While it had no block movement capabilities, except by very cumbersome block export and import, it did have insertion and revision capabilities. At each carriage return, one space on the tape was reserved for insertions. More important, all except the very first models incorporated two tape stations, and the ability to play from one tape while recording an updated tape on the other, incorporating insertions and deletions as desired. The two tape stations could also be played back simultaneously, typically merging a letter on one tape with a name and address list on the other.

The MT/ST also introduced what may be called word processing concepts. Within a fixed zone (1") preceding the right margin, spaces were converted into carriage returns, and outside it returns were changed into spaces. The concept of a "soft hyphen" was used for the first time: a hyphen that would print only if it fell within the 1" hyphenation zone, and would otherwise be ignored. An overstrike code was also implemented; this permitted underscoring.

Whereas the FlexoWriter only operated on a character basis, the MT/ST also operated on a word, line, and paragraph basis. The machine understood a word to be any string terminating with a space; a line was a string terminating with a carriage return. Two carriage returns constituted a paragraph boundary, and were not turned into spaces as single returns could be.

However, the MT/ST had no concept of a page; the division of text into pages and the numbering of pages had to be done by a human operator. While possible points of hyphenation in a word could be premarked, it had no hyphenation capability of its own. The machine did not permit operator hyphenation while playback was in process, and thus line endings were not always satisfactory. As it had no display screen, the only way to know what was on a

tape was to print it out at 15 characters per second. No tape updating without printing was possible either. The operator needed to listen to the tape transport to know whether it was skipping text or awaiting keyboard input. The MT/ST required alertness and discipline from the operator.

OTHER DEDICATED WORD PROCESSORS

Subsequently, IBM introduced a number of word processors incorporating various improvements; other manufacturers followed IBM's lead. None of these achieved the success of the MT/ST. The Magnetic Card Selectric Typewriter (1969) incorporated the concept of the page into processing; one page was stored on each magnetic card. In 1971 the Lexitron (not an IBM product) added a display screen, using paper only for the final output. IBM's Magnetic Card Executive Typewriter (1972) had proportional spacing in a single type face, sacrificing the interchangeable type elements of the Selectric. Magnetic Card Selectric Typewriter II (1973) added memory, allowing text to be stored and moved in memory and only stored on media when editing was completed. It also had the double pitch available on later Selectrics.

IBM's DisplayWriter and word processors from Wang and Lanier moved closer to the word processor as we know it today. Floppy disks gradually replaced cassette tapes as storage media. Named files were introduced. On-screen menus of functions and labeled function keys made it easier to perform tasks; opening, saving, combining, printing, and deleting files; moving, centering, justifying, and underlining text; combining standard text (a letter or a financial document) with varying data; adding page numbers, headers, and footers.

WORD PROCESSING ON MULTIPURPOSE COMPUTERS

Although not customarily thought of as such, the above pieces of hardware are computers, with input and output devices and data storage and manipulation ability. However, their programming was limited to that supplied by the manufacturer, and they could not be used for other tasks. Word processing has been done on both mainframe and minicomputers, in both of which the computer simultaneously served several users, but these never achieved acceptance outside of large businesses. Besides the cost of the computer, the printers were the primary limitation. Only daisy-wheel printers could produce office-quality output in the early 1980s, and they were slow in comparison with the processor speeds. Software for mainframe and minicomputer word processing soon trailed behind, in features and ease of use, that available on microcomputers. Mainframe administrators did not consider word processing a task particularly appropriate for their

computers, as it required large blocks of memory but did not need mainframe processing speed.

EARLY MICROCOMPUTERS

The microcomputer arrived on the scene in the mid-1970s. Early models used tape cassettes for data storage, with data encoded in an unreliable audio (analog) signal. There were two main families of central processing chips, the 8080 and the 6502 chip, which were later to evolve into the IBM-compatible and the Macintosh lines of computers, respectively. The commands used by the chips were the same for all machines using that chip. However, the formats by which data was stored and displayed on a screen were not standardized, meaning that each model of computer required a different version of the same program, and computers could not share data. Early dot-matrix printers, typically using a 7-pin matrix, produced a legible but low quality product, unsuitable for business correspondence. Very primitive software was written by hobbyists, or provided by hardware manufacturers.

The addition of floppy disk drives to computers in the late 1970s marked a great advance in the reliability and speed of data storage. It became practical for independent programmers to write and sell software. The only word processing program from this period to achieve recognition was Michael Shroyer's Electric Pencil, which introduced word wrap, eliminating the need to press the carriage return key at the end of each line. This was a great innovation for its day.

The advent, in the late 1970s, of the standard operating system CP/M (Control Program/Micro) brought vastly increased standardization. Formats for file and memory structure were standard across all machines of that class. By 1980 IBM Selectrics and Diablo and Qume daisy-wheel printers were coupled to computers, giving a good quality printed output and a variety of type styles, although at a high price. Changing type style meant stopping the printer and manually changing the printing element (in the case of the daisy-wheel printers this was a disk about 3 inches in diameter). The addition of memory to printers made bidirectional printing possible. This eliminated the delay caused by the return of the print head to the left margin position at the beginning of every line.

While the logical disk structure was standard, physical disk organization was unique to each computer. Standardized 8 inch disks were replaced with less standard 5.25 inch disks. The screen display codes were also not standardized. This meant that slightly different versions of a program were still required for each brand, and in some cases each model, of computer. It also meant that different brands of computers could not exchange disks, although conversion software and facilities appeared in the mid-1980s.

WORDSTAR

Throughout the CP/M period the predominant word processing program was WordStar, although there were other minor competitors, such as Select and Perfect Writer. By recent standards CP/M WordStar was very primitive, lacking features now taken for granted, such as a spelling checker, footnotes, and proportional spacing. Onscreen help was limited, and installation often required a technically knowledgeable operator. It could only support one printer at a time; multiple printers required that different versions of the program be prepared. Nevertheless, WordStar took full advantage of the features of the printers of the early 1980s. It supported super- and subscript, bold or shadow print, underscore, page numbers, and one-line headers and footers. It achieved a great success with its keyboard structure, in which cursor movement commands were arranged in a logical, one-hand design (Control-E for up, Control-S for left, Control-D for right, and Control-X for down). The MicroPro Corporation, publisher of WordStar, successfully sold its product to hardware manufacturers, such as KayPro and Morrow. It was thus "bundled" with the computer; purchase of that brand of computer featured WordStar included, at a much lower price than it would cost if purchased separately. "WordStar To Go," an abbreviated version, was stored on memory chips and sold with some of the first laptops.

MS-DOS WORD PROCESSING

In the early 1980s the CP/M computers were replaced by more powerful machines using the Microsoft Disk Operating System (MS-DOS). This system was chosen by IBM for its microcomputers, and although IBM never dominated microcomputers as it wanted to, it served to set a common technical core for a large family of "IBM-compatible" computers. Among other things, IBM's floppy disk format became standardized over a large number of brands of computers, permitting exchange of data with an ease that CP/M computers, with their manufacturer-specific formats, never achieved. A software producer needed only to prepare a single version of a program, which would then run on the machines of many manufacturers. The MS-DOS computers also vastly increased available memory, added subdirectories to their disk structures, added function keys and an "Alt" key to the keyboard, and were easily customizable without sacrificing compatibility.

This new standardization, plus the added speed of the machines, created a great hardware and software boom in the 1980s. The microcomputer software industry grew at a rapid pace; customers were eager to purchase the newly standardized machines for which abundant software was available. Prices of hardware plunged. Software gained

dramatically in features and ease of use, while also declining in price.

GENERAL CHARACTERISTICS OF MS-DOS WORD PROCESSING PROGRAMS

MS-DOS word processing programs offered more of everything. The increased memory and disk storage capability meant that more extensive on-screen help could be made available. Dot-matrix printers improved the quality of their letter shapes dramatically; print quality never attained that of daisy-wheel and Selectric printers, but the dot-matrix printers were much faster and far more flexible. They offered proportional spacing (available on some daisy-wheel printers, but never successfully supported by CP/M programs), italic, a variety of type sizes, better support for foreign language characters, and the ability to print pictures. All of this kept the word processing program developers scrambling, successfully, to keep up.

New features were added to the programs yearly: footnotes; endnotes; the ability to edit more than one document; descriptive, nonprinting file headers; split screen editing; mathematical functions on data contained within the document. The features of third-party (supplementary) programs were gradually incorporated into the main programs; macros (master commands to automate repetitive operations); data exchange with other programs; spelling checkers; thesauri; data encryption; outline processors; graphics (illustration) creation and editing; charting; file comparison; indexing; an equation editor. A word processing program actually became a package of programs, filling many disks. WordPerfect 5.0, for example, in addition to installation and setup programs came with PTR.EXE, a program to edit printer definition files; CONVERT.EXE, a file conversion program to import and export text and data; GRAPHICNV.EXE, a program to import illustrations; SPELL.EXE, to edit the spelling dictionaries; and WPINFO.EXE, a program to provide information about the user's configuration to assist in diagnosing installation problems. Available for a small additional cost was a macro editor, later incorporated into the main program.

These new features meant more complex programs, and frustration for many users. A new industry sprang up to provide training and learning aids (books and videos). Still, a significant body of users do not make efficient use of their word processors, and find them intimidating and confusing. Even experienced users often find the complexities of the programs frustrating, and to master every feature of a major program is a full-time job.

Specific Programs

WordStar failed to make the transition from CP/M to MS-DOS machines. The greatest failure in the history of word processing was WordStar 2000, an improved version of the

program with many new features such as footnotes, but with a completely different command structure and user interface. It was received indifferently by the existing user base, who already had put in overtime to learn the previous commands and were not eager to repeat the process. There were never enough first-time users of WordStar 2000 to mark the program as a success and force users of the older WordStar 3 to make a switch. As a result, faced with irate users, the publisher retreated to its previous user interface, and released WordStar 4. WordStar was further damaged by a group of dissident employees who founded a new company and offered a competing program, NewWord.

WordStar 4 offered macros, improved installation, and better on-screen help, but was basically an adaptation of the older CP/M program. During the time these developments were under way, WordStar was overtaken by Microsoft Word and WordPerfect, which were first to offer such new features as laser printer support and print preview. In one of the most egregious examples of "version inflation," WordStar released versions 5, 5.5, and 6.0, while WordPerfect more honestly released version 5.0 and 5.1. The implication is of course that the program with the higher number is better; since this view would be held only by less knowledgeable users, it is tantamount to a declaration of defeat.

Microsoft Word

In the mid-1980s, Microsoft Word was the leading word processing program, followed by WordPerfect, and very much in third place was XyWrite, a respected program for serious writers which never achieved the sales its partisans said it deserved. Word was written to take full advantage of the graphics capability of the MS-DOS computers. This allowed it to have a better display, including screen fonts for foreign language characters. It also offered superior formatting capabilities and style sheets; it was the first major program to incorporate an outline processor. Word was well-placed, by its graphics-based structure, to become the most successful program for the similarly graphics-based Macintosh, and to gain an early lead as the word processor for the IBM graphic interface Windows (also a Microsoft product). However, Word's lead, in the MS-DOS world, did not last long. Its menus were cryptic; function codes could not be searched for; and Microsoft, a controversial company which had many other software products, did not give Word as high a priority as the WordPerfect Corporation did its principal product.

Wordperfect

From the late 1980s and into the 1990s, the predominant word processing program was WordPerfect. This is only partly due to the features of the program. WordPerfect is a character-based (as opposed to graphics-based) program, its function keys are arbitrary and hard to learn, and while

it has been a strong competitor, it has never held the lead in flashy features.

The triumph of WordPerfect as the predominant word processing program is due at least as much to good management and business decisions as it is to the program's features. First, the program is available for a greater variety of operating systems than any other, although the MS-DOS version is the most popular. It currently is the only word processor that has a common file format for both MS-DOS and Macintosh versions. It has also been a leader in government and international sales, providing many more foreign language versions, and more support for foreign characters and alphabets, than any competitor. It has been more successful than any other company in providing a package of programs; a spreadsheet (PlanPerfect), a database (Data-Perfect), a drawing program (DrawPerfect), and a shell providing mail, calendar, and file management functions (WordPerfect Office). A number of other characteristics, while not as easy to proclaim in advertising, have endeared it to data processing professionals, whose recommendations have had a major impact in corporate decisions to adopt it; a macro programming language and editor, a merge programming language, soft keyboards, and the broadest printer support of any program. WordPerfect also has the best documentation in the industry, a significant advantage in a field long characterized by poorly written or inaccurate documentation.

Perhaps the biggest single factor in the success of WordPerfect is quite external to the program itself: the company's liberal policy for telephone assistance. It is WordPerfect's policy to provide purchasers of its microcomputer programs unlimited telephone assistance free of charge, and indeed it subsidizes the service within the United States by supplying "800" numbers. At first the company would verify that the caller had purchased its program; subsequently it provided service even to those with stolen copies.

The contribution of this decision to WordPerfect's success cannot be exaggerated. For new users, confused or faced with installation problems, it offered reassurance and help; for the intermediate it offered help with advanced features; for advanced users faced with program bugs it offered confirmation of the bugs and indirect access to expert assistance. The telephone assistance and reduced user frustration and greatly increased loyalty to the product. A feature much commented on was the addition of "hold jockeys," similar to radio disk jockeys, to calm users on hold during busy periods by playing music, giving progress reports on their calls, and offering news about WordPerfect products. The telephone help service also provided WordPerfect with invaluable feedback on user perceptions of its programs, and the company has shown an admirable ability to assemble and use the data so generated. However, the costs of providing this service have been heavy. It remains to be seen whether WordPerfect will be able to maintain this free service indefinitely.

Simpler Word Processors

As the major word processors grew so complex, a number of smaller, cheaper, and simpler alternatives emerged in the mid-1980s. These included PC Write, Bank Street Writer, First Choice, and a number of others. While each has a number of users, none of them has achieved predominance. In 1990, WordPerfect released LetterPerfect, a simpler and smaller version of its program that retained file compatibility.

Macintosh Computers

The CP/M and IBM-compatible microcomputers all use members of a single family of processing chips: the 8080 and its descendents the Z-80, 8088, 8086, 80286, 80386, and 80486. The other main family of computer processing chip, the 6502 and its descendents, gave birth to the Apple and then to the Macintosh computer, with the short-lived Lisa as an intermediary. The Apple computer, whose color, joysticks, and oversized letters made it very successful in schools, was never used for serious word processing. Its video display was too poor to have an 80 column by 24 line screen; thus it was not possible to see at all what things would look like on the screen.

The Macintosh, introduced about 1984, quickly gained a loyal and vociferous group of followers. Its operating system, self-installation, and graphical user interface made it far easier to install and use than IBM-compatible computers, which the company emphasized in its advertising. Documents could be seen on the screen just as they would be printed, and the writer had precise control over fonts and type sizes. In contrast with the IBM microcomputers, patents and copyrights protected the Macintosh from competitors, and to date there are no Macintosh-compatible computers. This meant, however, that prices remained much higher than in the more competitive IBM-compatible environment.

The Macintosh was never much used in an office environment or for word processing. The dot-matrix printer sold with it produced an output only marginally suitable for correspondence. For some time, there was no intermediate step between that printer and an expensive PostScript laser printer. The mouse was awkward for good typists, as it required that a hand be removed from the keyboard, and the control over typeface and type size was not only unneeded but even distracting to writers.^[1] The Macintosh's greatest success was in publishing and advertising, for which its graphics screen and precise preview of type, illustrations, and layout were invaluable.

WORD PROCESSING AND TYPESETTING

Reducing the cost of typesetting so that it could be incorporated in an office or small business budget has been a

long-standing goal of office equipment. Traditional lead type required expensive equipment and highly trained operators; it was slow to produce and correct. Adaptations of the electric typewriter provided proportionally spaced output of typeset quality, but justification—making an even right margin—meant that each line needed to be typed twice. The first keyboarding mechanically counted the length of the line, and the repetition inserted fractional spaces between words so as to align the right margin. IBM's entry in this field was the Selectric Composer, a piece of hardware vaguely resembling but much more complex than the Selectric typewriter, with proportional spacing and with three pitches (15, 17.4, and 19.8 characters per inch). Special ribbon and paper were used to obtain a very black and crisp output, suitable for offset printing.

A model of the Selectric Composer was soon fitted to read tapes created and corrected on the MT/ST. The machine calculated interword spaces, and it was thus necessary to type only once to achieve a justified output. Hyphenation during playback, though operator assisted, was implemented for the first time. While the Magnetic Tape Selectric Composer was still out of the price range for most offices, and was limited to a maximum type size of 12 points, its input could be prepared by a secretary without the special training required of a typesetter. It marked an important first step in the marriage of word processing and typesetting.

Although from early in the computer age, typesetters had developed the hardware needed to use computer files as input, this was limited to letters, numbers, and punctuation; formatting, control of type face or size, and use of special characters were only possible if complex codes were added to the computer files. The results could not be previewed on the computer, nor could the transferred files, once processed on the target hardware, be returned for further editing on the computer. The output devices were far too expensive for office or small business use.

Production of typeset output on the microcomputer itself required an affordable output device with good resolution, speed, and print quality, the ability to handle a variety of type sizes and special characters, and the processing power to calculate microspacing needed to justify lines. The latter is the simplest; the program uses a table containing the widths of each character, calculates the total length of the letters in a line by adding the width of each, subtracts this from the desired line length (measure), and divides the remainder by the number of interword spaces. The result is then sent to the printer as fractional spacing instructions. Additionally, good typesetting requires kerning; removing space between selected pairs of letters to achieve a satisfying visual effect. This added to the previous requirement the need to look up pairs of characters in a table and send fractional spacing adjustments to the printer between letters.

Proportional spacing was partially implemented on CP/M machines, and fully adapted on both MS-DOS and

Macintosh machines in the mid-1980s. Kerning was implemented with WordPerfect 5.0, in 1988. The output device of choice proved to be the laser printer. Daisy-wheel printers could handle proportional spacing, but not varying type sizes. Changes from roman to italic required that the machine be stopped twice for manual change of print wheels. Dot-matrix printers could change to different type sizes and styles without operator intervention, but were unacceptably slow when operated at their finest resolution. The blackness of their output was also unreliable.

These problems were resolved with the laser printer, which appeared on the scene in the mid-1980s. By the end of the 1980s prices had so declined that it was available to almost anyone needing to produce typeset material. Using a print engine adapted from the photocopy machine, the laser printer offered high speed and reliability together with good print quality.

All laser printers came with some typefaces built in. All but the earliest accepted and housed in memory electronic type stored in the memory chips of plug-in cartridges, or sent by the computer. The electronic type consisted of patterns of dots that would be printed on the page when the appropriate letter was sent from the computer. Any size or style of type could thus be accommodated. By the end of the 1980s and early 1990s, production of electronic type had grown into a new industry, offering the microcomputer-based typesetter virtually all the choices in type style previously available on dedicated typesetting equipment costing many times the price. Many previously unavailable fonts appeared, both ornamental (e.g., based on handwriting) and practical (exotic foreign languages; dead languages used in Biblical and historical studies).

Page design programs, sometimes described with the misleading label "Desktop Publishing," allowed microcomputer users to arrange headlines, text, and illustrations on pages with ease and precision. The leading programs were Aldus PageMaker and Ventura Publisher, and several simpler and less expensive alternatives.^[2]

THE FUTURE OF WORD PROCESSING

Hardware has always set the boundaries for word processing. Hard disks and larger computer memories meant larger and more powerful programs could be stored and run. Better graphics displays meant more characters could be shown. Better printers allowed growth from letter writing to typesetting.

The huge storage capacity of the optical disk means that word processing will be linked even further with a multimedia environment including pictures and sound. At the same time, access to huge bodies of electronic text, locally or remotely stored on optical media, is rapidly becoming a reality. Reading will eventually take place primarily on a screen, and word processing software will be used for reading as well as a writing. The software

offers the possibility of reading texts in new, nonlinear ways, creating links between blocks of text or between files (“hypertext”) which have no parallel in the conventional, printed world.

As written communication shifts to electronic rather than paper transmission, word processors will become more closely linked with electronic mail systems. If past trends continue, functions presently carried out by separate programs from different manufacturers—grammar checking, concordance producing—will also be incorporated into the concept of word processing. Typesetting will become even less distinguishable from word processing. Users will have the option of having display screens emulate the type styles of printed books. As operating systems become more standardized—Microsoft Windows, the very successful new user interface for the

IBM-compatible, resembles the Macintosh in many ways—word processors will also come to resemble each other more. They will thus become easier to learn. Voice input and output is also in the near future, as is hardware designed to place less stress on the human body (arms, fingers, back, and eyes).

World Intellectual Property Organization (WIPO)

Janice T. Pilch

Rutgers University Libraries, Rutgers University, New Brunswick, New Jersey, U.S.A.

Abstract

The World Intellectual Property Organization (WIPO) is a specialized agency of the United Nations that promotes the development of a balanced and effective international intellectual property system through cooperation among Member States and other international organizations and through the administration of international treaties. Long dedicated to the promotion and use of intellectual property as a means of stimulating innovation and creativity, the organization in recent years has directed effort toward matters relating to access to information in the public interest. Because the WIPO is responsible for international norm-setting on copyright, its decisions have an impact on the work of libraries and archives. The WIPO benefits from the participation of international and national library and archive organizations as accredited observers. This entry outlines the WIPO's activity and efforts to address international legal and policy issues that affect libraries, archives, and the public at the WIPO within the framework of advocacy.

INTRODUCTION

The World Intellectual Property Organization (WIPO) is a specialized agency of the United Nations (UN) with headquarters in Geneva, Switzerland, that promotes the international protection of intellectual property and fosters cooperation on copyrights, trademarks, industrial designs, and patents. Within the UN system, WIPO functions as an autonomous international organization established by intergovernmental (IGO) agreement. It is one of the 16 specialized agencies having wide international responsibilities in economic, social, cultural, educational, health, and related fields under Article 57 of the UN Charter and brought into relationship with the UN according to Article 63 of the charter. Others include UNESCO, the International Labour Organization, the World Health Organization, the International Monetary Fund, and the World Bank.

WIPO addresses the protection of intellectual property worldwide as a means of stimulating innovation and creativity through cooperation among Member States and in collaboration with other international organizations. In the field of copyright and related rights, WIPO administers a system of legal norms that have their origins in the invention of the printing press in the mid-fifteenth century and developed into an international copyright system in the second half of the nineteenth century. International norm-setting through treaties and other instruments provides direction for the international community and shapes national laws that have effect within the respective jurisdictions of Member States. From its origins, international copyright has been a dynamic system and this is no less true today. Copyright laws that protect literary, artistic, musical, dramatic, and other original creative works, and

related rights that extend to certain groups of rightsholders such as performers, producers of phonograms, and broadcasting organizations are in a constant state of evolution as they adapt to social change and new technologies.

In the twenty-first century, WIPO faces unique political, social, and cultural challenges in the field of copyright and related rights. First, digital technology has radically transformed the copyright landscape. As the means to access and share intellectual and creative content expand and as new digital content is created at exponential rates, maintaining copyright norms that serve the interests of creators and the needs of the world's users is a central challenge. Second, the concerns of developing nations in the global information society have become more pronounced. Efforts to strengthen the voice of developing and least developed nations and to mitigate the effects of globalization in the area of information access have resulted in numerous initiatives mainstreamed across WIPO committees toward equitable participation of all nations in the global information society. Third, the organization in recent years has directed attention generally toward access to information in the public interest, following its mission to "to lead the development of a balanced and effective international intellectual property (IP) system that enables innovation and creativity for the benefit of all."^[1]

WIPO benefits from the participation of international and national library and archival organizations as accredited observers. Within the framework of advocacy, they address international legal and policy issues that affect libraries, archives, and the public because of the many evolving aspects of intellectual property rights in the digital age. WIPO's engagement since 2004 on the issue of copyright limitations and exceptions to benefit blind and visually impaired persons, libraries and

archives, and education is a key effort toward achieving balance in international norms for the twenty-first century.

HISTORY

WIPO has its origins in the Paris Convention for the Protection of Industrial Property established in 1883 to set minimum international standards for the protection of industrial property (patents, marks, industrial designs, utility models, trade names, and geographical indications) and the Berne Convention for the Protection of Literary and Artistic Works established in 1886, the world's first international copyright treaty. These treaties were the result of an effort that began in the mid-nineteenth century to standardize protection of intellectual property among nations. The administrations of these conventions, or Unions, merged in 1892 to form the United International Bureaus for the Protection of Intellectual Property, commonly known by the French title *Bureaux Internationaux Réunis pour la Protection de la Propriété Intellectuelle* and the French acronym BIRPI. In 1960, BIRPI moved from Berne to Geneva. At the Intellectual Property Conference of Stockholm held from June 11 to July 14, 1967, a new treaty was adopted, the Convention Establishing the World Intellectual Property Organization (WIPO Convention), designating the International Bureau of WIPO as a successor to BIRPI.

WIPO began its work as an IGO organization in 1970 when the administrative provisions of the 1967 Stockholm Act of the Berne Convention entered into force, with the objectives of “promot[ing] the protection of intellectual property throughout the world through cooperation among States and, where appropriate, in collaboration with any other international organization” and “ensur[ing] administrative cooperation among the Unions.”^[2] In 1974, WIPO acquired the status of a specialized agency of the UN to promote the worldwide protection of intellectual property through cooperation of Member States and other international organizations and to administer the international treaties under its authority.

MEMBERSHIP AND GOVERNANCE

WIPO is a consensus-based organization in which Member States set the strategic direction for activities related to intellectual property and approve the organization's activities. With a constitution of 187 Member States, WIPO's reach extends to nearly all nations of the world. Delegations from Member States comprise the decision-making core of the organization. In addition, WIPO admits IGO and nongovernmental (NGO) organizations to serve as accredited observers. IGO and NGO representatives participate in the work of WIPO by making statements in

assemblies and committee meetings, providing written statements on issues under discussion, consulting with WIPO delegations, and engaging in other core WIPO activities within the framework of advocacy. There are currently 70 IGOs and 319 NGOs accredited as observers, representing the interests of libraries, archives, and museums, educational institutions, blind and reading disabled persons, indigenous peoples, consumers, members of the public, rightsholders, intellectual property industries, and other stakeholders in the intellectual property system.

ORGANIZATIONAL STRUCTURE

Various WIPO bodies are responsible for discussion, negotiation, and decision making on intellectual property issues and for administrative activity. Formal guidelines outlined in the WIPO General Rules of Procedure serve as standards for conduct of procedure and deliberation within WIPO bodies.^[3]

Decision-Making Bodies

The main decision-making bodies, which meet annually, are responsible for the highest-level decisions within the organization:

- The WIPO General Assembly, described in Article 6 of the WIPO Convention, is composed of the Member States of WIPO, which are also members of any of the Unions. Its main functions are to appoint the director general upon nomination by the Coordination Committee, to review and approve reports of the director general and reports and activities of the Coordination Committee, to adopt the biennial budget of the Unions, to adopt the financial regulations of the organization, to determine the working languages of the Secretariat, to invite states to become parties to the WIPO Convention, and to accredit non-Member States and organizations as observers.
- The WIPO Conference, described in Article 7 of the WIPO Convention, consists of states that are parties to the WIPO Convention. Its main functions are to discuss intellectual property issues and adopt recommendations, to adopt the biennial budget of the Conference, to establish the biennial program of legal–technical assistance, to adopt amendments to the WIPO Convention, and to accredit non-Member States and organizations as observers.
- The WIPO Coordination Committee, described in Article 8 of the WIPO Convention, consists of States that are party to the WIPO Convention and also members of the Executive Committee of the Paris Union or the Executive Committee of the Berne Union, or both. It gives advice to the organs of the Unions, the General

Assembly, the Conference, and the director general, on financial and other matters. It prepares the draft agenda for the General Assembly and the draft agenda, draft program, and budget of the Conference. It also nominates a candidate for the position of director general for appointment by the General Assembly and appoints an acting director general if the position becomes vacant between sessions of the General Assembly.

In addition, decision-making capacity is exercised by the assemblies of the Member States of the Unions.

Activity

The organization's activity is carried out through assemblies, committees, and working groups consisting of delegations from the Member States, as well as through the work of the Secretariat that develops programs to implement strategic goals and provides expertise to Member States.

WIPO has defined nine strategic goals:

1. A balanced evolution of the international normative framework for intellectual property
2. Provision of premier global intellectual property services
3. Facilitating the use of intellectual property for development
4. Coordination and development of the global intellectual property infrastructure
5. World reference source for intellectual property information and analysis
6. International cooperation on building respect for intellectual property
7. Addressing intellectual property in relation to global policy issues
8. A responsive communications interface between WIPO, its Member States, and all stakeholders
9. An efficient administrative and financial support structure to enable WIPO to deliver its programs

WIPO bodies advance the organization's strategic goals through a broad range of activity:

- *Norm-setting*: Administration of multilateral treaties, conventions, and agreements and supporting the further evolution of the international intellectual property framework by developing laws and standards.
- *Services*: Providing global intellectual property services that offer easy and cost-effective means for obtaining international protection for patents, trademarks, designs, and appellations of origin, and for resolving disputes.
- *Development and technical assistance*: Within the framework of capacity-building, assisting governments

and organizations in developing and least developed nations to build national intellectual property infrastructures through policies and strategies that support economic development.

- *Technical infrastructure*: Providing access to free WIPO databases of intellectual property information and technical platforms for sharing of information among national intellectual property offices.
- *Promoting intellectual property*: Promoting intellectual property and understanding and respect for intellectual property norms internationally.

WIPO cooperates with other agencies of the UN in Geneva and has external offices in New York, Rio de Janeiro, Singapore, and Tokyo. On December 22, 1995, WIPO signed an agreement between the World Intellectual Property Organization and the World Trade Organization (WTO), which came into force on January 1, 1996, establishing a commitment to support and cooperate with the WTO in matters relating to intellectual property.^[4]

Committees

WIPO Member States participate in a large number of committees. The committee structures evolve with the directions taken by WIPO in international norm-setting and development. Advisory committees and ad hoc committees may focus on emerging issues in intellectual property, to serve as a means for exploration, study, and scoping of issues. This often involves the creation of reports, recommendations, and proposals. Any committee or other body may establish working groups to study specific issues in more detail. Some of the most important committees include the following:

Permanent committees

- The Program and Budget Committee sets the biennial budget, closely linked to the strategic goals and priorities of the organization.
- The Committee on Development and Intellectual Property (CDIP) addresses issues related to intellectual property and development as part of the organization's commitment to the WIPO Development Agenda adopted in 2007.
- The Intergovernmental Committee on Intellectual Property and Genetic Resources, Traditional Knowledge and Folklore (IGC) works toward normative solutions for the protection of genetic resources, traditional knowledge, and traditional cultural expressions, also referred to as expressions of folklore.
- The Advisory Committee on Enforcement addresses global enforcement issues through technical assistance to Member States and coordination with private sector organizations to fight piracy and counterfeiting and

engages in education and training activity, within the framework of recommendation 45 of the WIPO Development Agenda.

Standing committees

WIPO established a system of standing committees in 1998 to facilitate the progressive development of international intellectual property law. Standing committees bring together representatives of Member States at regular intervals to discuss and reach consensus on global intellectual property norms. Norm-setting activity includes making recommendations to the General Assembly to conclude new treaties, to amend treaties, or to adopt other forms of international agreement. The adoption of new treaties requires the convening of diplomatic conferences, high-level meetings of Member States where the language of new treaties is finalized.

- The Standing Committee on the Law of Patents is a forum for discussion, coordination, and guidance on the development of patent law.
- The Standing Committee on the Law of Trademarks, Industrial Designs and Geographical Indications is a forum to discuss issues, facilitate coordination, and provide guidance on the development of international law on trademarks, industrial designs, and geographical indications, including the harmonization of national laws and procedures.
- The Standing Committee on Copyright and Related Rights (SCCR) advances international norms in copyright and related rights. Many of the issues on the committee's current agenda concern the development of copyright law that addresses new technologies and the Internet.
- The Committee on WIPO Standards was created in 2009 as a forum for discussion of standards relating to industrial property information and documentation. It grew out of the work of the Standards and Documentation Working Group of the Standing Committee on Information Technologies.

WIPO Secretariat

The Secretariat provides administrative and specialized support to all WIPO bodies. It consists of the WIPO staff of specialists in intellectual property law and practice, administration, and related fields such as economics, information technology, public policy, and translation. The WIPO Secretariat, called the International Bureau, is responsible for coordinating meetings of Member States and implementing their decisions, administering international registration systems, developing and implementing programs established to achieve the organization's goals, and providing legal-technical assistance to Members. The

Secretariat operates under the directorship of the WIPO director general and the deputy or assistant director general of each of its seven sectors: brands and designs, development, global issues, innovation and technology, administration and management, culture and creative industries, and global infrastructure.

WIPO's program of technical assistance to developing and least developed nations is one of its major activities, providing legislative advice, training and consultation programs in intellectual property, support for national policy development and national intellectual property infrastructure, human resource and institutional development, automation services, and enforcement programs.^[5] It is worth noting that this activity is often criticized by civil society organizations for having an inherent bias toward the interests of rightsholders in developed nations because of the emphasis on strengthening standards of intellectual property protection and enforcement in developing nations.

TREATY ADMINISTRATION

WIPO administers 26 international treaties, of which 7 are in the area of copyright and related rights. The most recent WIPO treaty, the Marrakesh Treaty to Facilitate Access to Published Works for Persons Who Are Blind, Visually Impaired, or Otherwise Print Disabled, was adopted on June 27, 2013. The 26 treaties administered by WIPO include its foundation treaty:

- Convention Establishing the World Intellectual Property Organization (1967)

Treaties in the area of copyright and related rights include

- Berne Convention for the Protection of Literary and Artistic Works (1886)
- International Convention for the Protection of Performers, Producers of Phonograms and Broadcasting Organizations (Rome Convention) (1961)
- Convention for the Protection of Producers of Phonograms against Unauthorized Duplication of their Phonograms (Geneva Convention) (1971)
- WIPO Copyright Treaty (WCT) (1996)
- WIPO Performances and Phonograms Treaty (WPPT) (1996)
- Beijing Treaty on Audiovisual Performances (2012)
- Marrakesh Treaty to Facilitate Access to Published Works for Persons Who Are Blind, Visually Impaired or Otherwise Print Disabled (2012)

Intellectual property treaties establishing basic standards of protection in each member country in the area of patents, trademarks, industrial designs, utility models, and geographical indications include

- Paris Convention for the Protection of Industrial Property (1883)
- Madrid Agreement for the Repression of False or Deceptive Indications of Source on Goods (1891)
- The Brussels Convention Relating to the Distribution of Program-Carrying Signals Transmitted by Satellite (1974)
- Nairobi Treaty on the Protection of the Olympic Symbol (1981)
- Treaty on Intellectual Property in Respect of Integrated Circuits (Washington Treaty) (1989)
- Trademark Law Treaty (1994)
- Patent Law Treaty (2000)
- Singapore Treaty on the Law of Trademarks (2006)

Global protection system treaties providing an international registration or filing system for intellectual property to simplify the application or filing process in all countries in which protection is sought include

- Madrid Agreement Concerning the International Registration of Marks (1891)
- Hague Agreement Concerning the International Registration of Industrial Designs (1934)
- Lisbon Agreement for the Protection of Appellations of Origin and their International Registration (1958)
- Patent Cooperation Treaty (1970)
- Budapest Treaty on the International Recognition of the Deposit of Microorganisms for the Purposes of Patent Procedure (1977)
- Protocol Relating to the Madrid Agreement Concerning the International Registration of Marks (1989)

Treaties that create classification systems that index information on inventions, trademarks, and industrial designs and facilitate information retrieval include

- Nice Agreement Concerning the International Classification of Goods and Services for the Purposes of the Registration of Marks (1957)
- Locarno Agreement Establishing an International Classification for Industrial Designs (1968)
- Strasbourg Agreement Concerning the International Patent Classification (1971)
- Vienna Agreement Establishing an International Classification of the Figurative Elements of Marks (1973)

WIPO AND THE DEVELOPMENT OF INTERNATIONAL COPYRIGHT NORMS

In the global information society, international copyright norms govern access to information in all parts of the world. International copyright treaties and agreements, implemented into national legislation, form a system of interrelated laws that provide a basis for copyright

protection for literary and artistic works and neighboring rights protection for performances, producers of phonograms, and broadcasting organizations.

Copyright laws are shaped by the international treaties and agreements that have developed since the late nineteenth century to provide some degree of harmonization across national jurisdictions. For more than a century, major treaties and conventions have been established to respond to needs arising from the increasing interdependence of nations. International agreements are in a constant process of change and are shaped by social and economic needs and technological advances.

The Berne Convention for the Protection of Literary and Artistic Works was adopted in 1886 as the result of an effort that began in the mid-nineteenth century, when international cooperation was needed to standardize protection of authors' rights among nations. It was amended eight times over the course of nearly a century to meet the evolving social and technological landscape. Gradually, there was a need to address specific aspects of copyright protection relating to computer technology and digital networks. The WCT and WPPT were adopted in 1996 for this purpose. Expanding on the Berne Convention, they adapted copyright to the digital age. The Beijing Treaty on Audiovisual Performances was adopted in June 2012 to protect the rights of audiovisual performers, defined as actors, singers, musicians, dancers, and other persons who act, sing, deliver, declaim, play in, interpret, or otherwise perform literary or artistic works or expressions of folklore. The treaty was designed to fill the gap in related rights protections left by the 1996 WPPT that protected audio performers but not audiovisual performers.

The adoption on June 27, 2013, of the *Marrakesh Treaty to Facilitate Access to Published Works for Persons Who Are Blind, Visually Impaired, or Otherwise Print Disabled* was the result of an effort spurred by citizens and civil society organizations to facilitate uses of new information and communication technologies to benefit persons with visual impairments or with other print disabilities through an enhanced legal framework at the international level. It is the first treaty in history dedicated to the expansion of copyright limitations and exceptions.

WIPO continues to deliberate on the adoption of a treaty for the protection on broadcasting organizations. Proponents of the treaty proposal argue that advances in technology are not adequately covered by the 1961 Rome Convention, and that a treaty covering broadcasting and cablecasting is necessary in order to prevent piracy and theft of signals. This is also an issue that was left out of the WPPT. Discussions that began at the WIPO Worldwide Symposium on Broadcasters' Rights in 1997 gradually led to treaty proposals that continue in the SCCR.

WIPO's engagement since 2004 on the issue of copyright limitations and exceptions to benefit blind and visually impaired persons, libraries and archives, and education is a key effort toward achieving balance in international norms for the twenty-first century. Following

the success of the Marrakesh Treaty, the SCCR continues its discussions toward the possible adoption of treaty instruments to benefit libraries, archives, and education.

LIBRARIES, ARCHIVES, AND INTERNATIONAL COPYRIGHT

WIPO benefits from the active participation of international and national library organizations as accredited observers at committee meetings and other events. Library and archival groups contribute to the promotion of a balanced and equitable international intellectual property system and share common interests with other non-governmental, nonprofit organizations working in the public interest, such as those dedicated to environmental and sustainable development concerns, consumer groups, charities, organizations representing the interests of blind and visually impaired persons, organizations representing indigenous peoples, and organizations representing educational institutions.

Because WIPO is responsible for international norm-setting on copyright, its decisions have an impact on the work of libraries and archives. Decisions made at WIPO may result in new international treaties that are implemented into national copyright laws. They may also result in nonbinding forms of norm-setting such as recommendations, resolutions, declarations, or guidelines. Libraries share a unique social responsibility for preservation of and access to the world's intellectual heritage and have an interest in promoting copyright laws that provide the broadest possible use of information for creativity, research, and education. Library and archival associations with accreditation at WIPO actively respond to and develop proposals to influence international copyright norms at the SCCR. They have also been active at the CDIP and the IGC and in other fora. Participation of library and archival organizations at WIPO benefits the broadest possible range of social interests.

Among the accredited international NGOs are those representing libraries, archives, and museums: Electronic Information for Libraries (EIFL), the European Bureau of Library, Information and Documentation Associations, the International Council of Museums, the International Council on Archives (ICA), the International Federation of Library Associations and Institutions (IFLA), the Scholarly Publishing and Academic Resources Coalition, and the Special Libraries Association. Among the national NGOs representing libraries, archives, and museums are Corporación Latinoamericana de Investigación de la Propiedad Intelectual para el Desarrollo (Corporación Innovarte), the German Library Association, the Library Copyright Alliance (LCA), the Italian Library Association, and the Society of American Archivists.

LIBRARY ADVOCACY AT WIPO

Issues being discussed at the highest levels in international policymaking have direct implications on the work of libraries and the future of information access.

Copyright Limitations and Exceptions for Libraries and Archives

One of the key issues of library advocates at WIPO is the need to reinforce copyright limitations and exceptions by means of a new international agreement. Work on limitations and exceptions occurs at the meetings of the SCCR. In successive meetings of the SCCR and the WIPO General Assembly, with increasing involvement since 2004, library and archival groups have argued in favor of global norms for limitations and exceptions that enable uses of works without prior consent of or payment to the copyright holder for purposes such as research, scholarship and teaching, library preservation, and interlibrary loan. They take the position that limitations and exceptions are a fundamental part of the copyright system but have not expanded at an equal pace with standards of protection introduced by new WIPO treaties in the last two decades and by the 1994 WTO Agreement on Trade-Related Aspects of Intellectual Property Rights that added a new dimension of enforcement by linking intellectual property protection with international trade. Other factors that have prompted library and archival organizations to voice their concerns include extension of copyright terms, anticircumvention legislation, and an increasing culture of enforcement in many nations. Their concerns are expressed in statements, referred to as interventions, at official meetings and also in panels and discussions held as side events in the course of committee sessions.^[6]

Library and archival advocates generally support the positions of developing and least developed nations in opposing higher and more rigid standards of protection that are not in the interests of developing nations and that hinder them from equitable participation in the global information society. In keeping their markets open for other types of trade, developing and least developed nations often adopt higher standards of protection than might best serve them domestically, with the effect that available limitations and exceptions are not used optimally for creativity, research, and education. Free trade agreements that incorporate high standards of intellectual property protection are considered by library advocates to hinder access to knowledge and to thwart social, cultural, and economic development. IFLA, together with ICA, EIFL, and Corporación Innovarte, is working with WIPO Member States to gain support for a binding international instrument to update copyright limitations and exceptions for libraries and archives worldwide.

To address matters of the public interest, in the last decade WIPO has initiated a series of expert studies highlighting the importance of copyright limitations and exceptions in the interest of blind and visually impaired persons, libraries and archives, and education:

- *WIPO Study on Limitations and Exceptions of Copyright and Related Rights in the Digital Environment*, prepared by Sam Ricketson^[7]
- *Automated Rights Management Systems and Copyright Limitations and Exceptions*, prepared by Nic Garnett^[8]
- *Study on Copyright Limitations and Exceptions for the Visually Impaired*, prepared by Judith Sullivan^[9]
- *Study on Copyright Limitations and Exceptions for Libraries and Archives*, prepared by Kenneth Crews^[10]
- *Study on the Limitations and Exceptions to Copyright and Related Rights for the Purposes of Educational and Research Activities in Latin America and the Caribbean*, prepared by Juan Carlos Monroy Rodríguez^[11]
- *WIPO Study on Limitations and Exceptions for Copyright and Related Rights for Teaching in Africa*, prepared by Joseph Fometeu^[12]
- *Study on Limitations and Exceptions for Copyright for Educational Purposes in the Arab Countries*, prepared by Victor Nabhan^[13]
- *WIPO Study on the Copyright Exceptions for the Benefit of Educational Activities for Asia and Australia*, prepared by Daniel Seng^[14]
- *Study on Copyright Limitations and Exceptions for Educational Activities in North America, Europe, Caucasus, Central Asia and Israel*, prepared by Raquel Xalabarder.^[15]

The studies are comparative in nature, comparing levels of limitations and exceptions across national laws worldwide. The *Study on Copyright Limitations and Exceptions for Libraries and Archives* provides the first comprehensive overview of statutory provisions in national copyright laws of WIPO Member States for the benefit of libraries and archives and underlines the need for expanding the scope of copyright limitations and exceptions worldwide.

In support of increasing minimum levels of limitations and exceptions internationally, the US-based LCA, along with EIFL and IFLA, drafted a *Statement of Principles on Copyright Exceptions and Limitations for Libraries and Archives* in May 2009.^[16] The statement outlines the urgency of taking action to expand limitations and exceptions to meet the needs of librarians and the public in the digital environment. The statement asks WIPO Member States to address the gaps in copyright provisions for libraries and archives in their national laws. It supports WIPO's commitment to developing nations in the WIPO Development Agenda adopted in 2007 to ensure that intellectual property law and policy continue to serve the public good in a balanced way in all parts of the world. It

respectfully requests Member States to adopt 12 principles to guide the formulation of copyright limitations and exceptions for libraries and archives in national copyright laws:

- *Preservation*: A library should be permitted to make copies of published and unpublished works in its collections for purposes of preservation, including migrating content to different formats.
- *Legal deposit*: Legal deposit laws and systems should be broadened to include works published in all formats and to allow for preservation of those works.
- *Interlibrary loan and document supply*: Libraries should be able to supply documents to the user directly or through the intermediary library irrespective of the format and the means of communication.
- *Education and classroom teaching*: It should be permissible for works that have been lawfully acquired by a library or other educational institution to be made available in support of classroom teaching or distance education in a manner that does not unreasonably prejudice the rightsholder. A library or educational institution should be permitted to make copies of a work in support of classroom teaching.
- *Reproduction for research or private purposes*: Copying individual items for or by individual users should be permitted for research and study and for other private purposes.
- *Provision for persons with disabilities*: A library should be permitted to convert material from one format to another to make it accessible to persons with disabilities. The exception should apply to all formats to accommodate user needs and technological advances. To avoid costly duplication of alternative format production, cross-border transfer should be permitted.
- *General free use exceptions applicable to libraries*: A general free use exception consistent with fair practice helps ensure the effective delivery of library services.
- *Orphan works*: An exception is needed to resolve the problem of orphan works, where the rightsholder cannot be identified or located.
- *Copyright term*: Consistent with the Berne Convention, the general term of copyright should be the life of the author plus 50 years.
- *Technological protection measures that prevent lawful uses*: It should be permissible for libraries and their users to circumvent a technological protection measure for the purpose of making a noninfringing use of a work. Implementation of anticircumvention legislation in many nations exceeds the requirements of Article 11 of the WIPO Copyright Treaty, effectively eliminating existing exceptions in copyright law.
- *Contracts and statutory exceptions*: Contracts should not be permitted to override exceptions and limitations. The goals and policies providing for exceptions

are important statements of national and international principle and should not be varied by contract.

- *Limitation on liability:* There should be a limitation on liability for libraries and library staff who act in good faith, believing or having reasonable grounds to believe, that they have acted in accordance with copyright law.

The statement is part of the sustained effort that began in 2004 to encourage WIPO to address copyright limitations and exceptions for blind and visually impaired persons, for libraries and archives, and for education. As the issue advanced at WIPO, in November 2010 the SCCR officially placed limitations and exceptions on its agenda and established a work program and a timetable for discussion over several years.

An effort by library and archival associations to prepare more formal proposals in the form of a draft treaty produced the *Treaty Proposal on Limitations and Exceptions for Libraries and Archives* by IFLA, ICA, EIFL, and Corporación Innovarte.^[17] The draft treaty sets out key issues for libraries and archives in taking a global approach to copyright limitations and exceptions to secure the effective and unhindered flow of information essential for global equality of access to research, ideas, and innovation. The treaty proposal is composed of 30 articles outlining the rights and obligations of Member States in reinforcing the role of libraries and archives in the digital future. Core articles cover

- Right to Parallel Importation
- Right to Acquire Works
- Right to Library and Archive Lending and Temporary Access
- Right of Reproduction and Supply of Copies by Libraries and Archives
- Right of Preservation of Library and Archival Materials
- Right to Use of Works and Material Protected by Related Rights for the Benefit of Persons with Disabilities
- Right to Access Retracted and Withdrawn Works
- Right of Use of Orphan Works and Materials Protected by Related Rights
- Right to Cross-Border Uses
- Right to Translate Works and Materials Protected by Related Rights
- Obligation to Respect Exceptions to Copyright and Related Rights
- Obligations Concerning Technological Protection Measures
- Limitation on Liability for Libraries and Archives
- Legal Deposit
- Government Publications
- Right to Extract and Reuse Facts and Information

At the SCCR/23 meeting in November–December 2011 and in subsequent meetings, library and archive groups

gained sufficient support from WIPO Member States to bring their proposals into an official working document, the *Working Document Containing Comments on and Textual Suggestions towards an Appropriate International Legal Instrument (in Whatever Form) on Exceptions and Limitations for Libraries and Archives*.^[18] An extensive document, it contains proposed text and comments offered by Member States in the course of discussions on 11 cluster topics: preservation; right of reproduction and safeguarding copies; legal deposit; library lending; parallel importations; cross-border issues; orphan works, retracted and withdrawn works, and works out of commerce; limitations on liability of libraries and archives; technological measures of protection; contracts; and the right to translate works. As of January 2014, the SCCR was continuing its text-based work toward an appropriate international legal instrument or instruments—whether model law, joint recommendation, treaty, or other form—with the target to submit recommendations on limitations and exceptions for libraries and archives to the WIPO General Assembly by late 2014.

Digital Preservation and Copyright

Digital preservation has attracted attention at WIPO as an issue deserving more analysis. One of the most critical areas in which copyright limitations and exceptions have failed to maintain a balance in the digital environment is library preservation, which faces an uncertain future due to the absence in many nations of adequate copyright laws and policies. In July 2008, WIPO held its first International Workshop on Digital Preservation and Copyright at which national representatives presented preservation scenarios in their own countries, revealing variations and flaws in public policy and legal approaches to preservation of cultural heritage and memory. The workshop coincided with a study released in July 2008 by the International Digital Preservation and Copyright Initiative to survey recent developments and trends in digital preservation and copyright. The *International Study on the Impact of Copyright Law on Digital Preservation*^[19] provides recommendations to improve national copyright and related rights laws and policies that concern the digital preservation of copyrighted works.

The report and the workshop emphasized the global need for more attention to limitations and exceptions for digital preservation in view of the fact that many works are physically disappearing, resulting in loss of cultural heritage and the historical record. Highlighting that this problem is likely to become more serious more in the coming years, participants in the workshop supported adoption of provisions in copyright laws to enable more robust systems of digital preservation.

Copyright Limitations and Exceptions for Persons Who Are Blind, Visually Impaired, or Otherwise Print Disabled

The World Blind Union (WBU) set a path for development of new international standards for limitations and exceptions in the public interest that culminated in the adoption of the Marrakesh Treaty in June 2013. With strong support from civil society groups, in 2003 the WBU resumed efforts dating to a 1985 report that recommended a new international instrument permitting production and distribution of special media materials and services for handicapped persons.^[20] The WBU actively urged WIPO to address the needs of the visually impaired, emphasizing the need for greater harmonization in copyright limitations and exceptions globally and for provisions permitting cross-border export and import of works in accessible formats.

In October 2008, the WBU presented a proposal for a possible Treaty for Improved Access for Blind, Visually Impaired and Other Reading Disabled Persons.^[21] It was formally introduced at the May 2009 SCCR meeting by Brazil, Ecuador, and Paraguay. The two main features of the proposed treaty were to provide a minimum standard for limitations and exceptions for the blind and visually impaired and reading disabled, reflecting current technological opportunities, and to allow for the import and export of works in accessible formats by eligible parties.

Library organizations strongly supported the proposal, arguing that the need for improved access to copyright-protected works in readable formats, such as Braille, large print, and audio versions is universal. National laws in some countries allow such copying and adaptation without the permission of rightsholders, but in other countries such activity could infringe copyright if undertaken without authorization. The decision of the SCCR in 2010 to include limitations and exceptions officially in its agenda led to intensive discussions of this proposal as well as those concerning libraries and archives and education in sequence. The WBU effort succeeded in the adoption of the Marrakesh Treaty at a diplomatic conference in Marrakesh on June 27, 2013, coinciding with the birthday of Helen Keller. It is the first international treaty in history dedicated to the expansion of copyright limitations and exceptions. As of January 2014, the treaty had been signed by 60 nations.^[22]

Copyright Limitations and Exceptions for Education and Persons with Other Disabilities

Work on an international instrument to expand limitations and exceptions for education is also in progress at WIPO and is strongly supported by civil society organizations asserting that a binding international instrument would be particularly effective in facilitating uses for education in

developing and least developed countries to bridge the knowledge gap and the digital divide. Additionally, it would include exceptions for disabilities not covered by the Marrakesh Treaty.

A compilation of proposals and comments proposed by the Member States was prepared by the WIPO Secretariat as a lengthy working document, the *Provisional Working Document towards an Appropriate International Legal Instrument (in Whatever Form) on Limitations and Exceptions for Educational, Teaching and Research Institutions and Persons with Other Disabilities Containing Comments and Textual Suggestions*.^[23] It constitutes the basis for continued text-based work being undertaken by the SCCR.

Topics included in the working document cover definitions, generally applicable considerations including flexibilities; uses (educational, teaching, and research institutions; in-classroom uses; uses outside the classroom; availability on an interactive basis and communication to the public for educational purposes; anthologies and chrestomathies; distance learning; research; and reverse engineering); persons with other disabilities; broader topics with implications for education (technology; orphan works and withdrawn or out of print works; public domain; contracts; Internet service provider liability; importation and exportation; and public health or security).

WIPO Development Agenda

Library groups have been active in support of the WIPO Development Agenda, a set of 45 recommendations adopted on September 28, 2007, by the WIPO General Assembly.^[24] It aims to address the interests and needs of developing and least developed countries within the international intellectual property system. This initiative originated in an effort to ensure that intellectual property law and policy continue to serve the public good by encouraging and rewarding innovation and creativity in a balanced way in all parts of the world. Upon its adoption, the WIPO Development Agenda was viewed as a major historical shift in the direction of WIPO because it addresses the knowledge gap and the digital divide that separate wealthy nations from poor nations.

The library groups at WIPO offer a critical perspective on the possibilities of social, economic, and cultural development through access to information and knowledge. Libraries have long served as the foundation for the preservation and broadest possible dissemination of knowledge in societies. Library organizations have articulated support for a copyright system that is balanced to serve all members of society in all parts of the world. In contributing to discussions that transform the 45 recommendations into concrete activities, the library community has advocated at WIPO to enable developing and least developed

countries to fully benefit from the global intellectual property system through

- A fair balance between intellectual property protections and the public interest
- Minimizing levels of copyright protection in developing and least developed countries
- A robust public domain
- Adequate limitations and exceptions for the purposes of education, research, learning, creativity, and preservation of information
- Access to knowledge and technology to foster innovation, material progress, and social well-being
- The goals of information literacy
- Bridging the digital divide
- Library participation in local efforts at technical assistance and capacity building in developing and least developed countries
- Balanced IP education in developing and least developed countries
- New approaches to the licensing of copyrighted works
- The social good that results from a true balance between intellectual property protections and the public interest.^[25]

The WIPO CDIP is concerned exclusively with the WIPO Development Agenda, but the work program to implement the recommendations is being mainstreamed into the activity of other WIPO bodies.

Traditional Cultural Expression

The international community has been engaged for over four decades in discussions concerning copyright and other legal protection of traditional cultural expression. Traditional and indigenous communities have long sought respect and recognition for their creative expressions ranging from stories, myths, folk tales, songs and music, to symbols, designs, paintings, sculptures, carvings, handicrafts, dances, and rituals. Existing international and national legal systems are not typically compatible with indigenous culture and law, and they do not sufficiently address the concerns of indigenous peoples for protection of their creative heritage.

There is no international mandate for protection of traditional cultural expression, and there is great variation in the level of protection for indigenous and traditional works in national laws. Some nations protect traditional cultural expression, while others do not, and still others do not specify in their laws. There is still a lack of consensus internationally about the type of protection, if any, that would best apply universally to traditional works. The issue has taken on new dimensions since WIPO established the IGC that began working in 2001 toward a solution to the protection of traditional

cultural expressions, also referred to as expressions of folklore.^[26]

The Berne Convention was amended in 1967 by Article 15(4) to provide a means for protecting works of folklore. Various sets of model laws and provisions have also been drafted over the years by WIPO and UNESCO. Expert groups have addressed the issue, and indigenous groups have been active advocates at WIPO. The IGC has been working toward possible *sui generis* protection, a special kind of protection for traditional cultural expression that falls outside the framework of the existing copyright system because the copyright system is not suited for works that are traditionally unpublished, often not fixed in tangible medium, created not by one individual known author but collectively by a community, and created not on a certain date but over time.

After years of discussion that did not lead to agreement, the committee's mandate was renewed in October 2013 and it continues to work on text-based negotiations with the goal of reaching an agreement on an international legal instrument or instruments to ensure the effective protection of genetic resources, traditional knowledge, and traditional cultural expressions, if consensus can be reached on this issue.

CONCLUSION

As the governance of intellectual property evolves in the twenty-first century through norm-setting activity at WIPO and as technology further advances, decisions made by WIPO will continue to have a direct impact on libraries and archives. Participation by library and archival organizations in WIPO discussions builds the cooperation and understanding necessary for a balanced evolution of copyright law, the key to WIPO's mission. Library and archival organizations view their engagement with WIPO Member States as a way to influence the direction of copyright law and to support fair and equitable use of copyrighted works into the digital future.

World Summit on the Information Society (WSIS)

Alex Byrne

University of Technology, Sydney, Sydney, New South Wales, Australia

Abstract

Promoted by the United Nations organizations, the World Summit on the Information Society was initiated to interrogate the global issues and challenges resulting from the widespread use of information and communication technologies and the growth of the information economy and to propose global strategies. Its first phase, held in Geneva in December 2003, was directed toward the adoption of a declaration and an action plan. The second phase, held in Tunis in November 2005, focused on reaffirming the commitment and advancing implementation of the agreed goals. Identifying the crucial role of libraries and information services as enablers for a fair and just information society, the International Federation of Library Associations and Institutions, worked successfully in concert with other civil society organizations to highlight the vital issues including freedom of access to information, information literacy, and strategies to overcome the digital divide.

INTRODUCTION

The proposal to hold a global summit meeting on the information society emerged from the growing concern about the implications of the “digital divide,” the gap between communities or nations with adequate access to information and communications technologies—and the services they make possible—and those whose access is deficient. Initiated at the 1998 session of the Plenipotentiary Conference of the International Telecommunication Union (ITU) in Minneapolis, United States, the proposal for the Summit was formally adopted by the General Assembly of the United Nations (UN) on December 21, 2001.^[1]

That resolution proposed that the outcomes of the World Summit on the Information Society (WSIS) should consist of a common vision and understanding of the information society, a declaration or principles, and an action plan to be implemented by Governments, international institutions, and all sectors of civil society. This signaled at the outset that this Summit process, to a greater extent than previous UN summit meetings, would recognize and involve civil society. The resolution also made particular reference to the urgency of providing effective access to information, knowledge and communication technologies for all, and especially people in developing nations. In addition, the resolution acknowledged the complexity of the issues to be addressed by endorsing the holding of WSIS in two phases, the first in Geneva from December 10 to December 12, 2003 and the second in Tunis in 2005, again unlike the singular process adopted for previous summits.

PROCESS

The framing of the Summit’s purpose drew on background work by the ITU and the UN Administrative Committee on Coordination and the consensus about future global priorities expressed by nations in the UN Millennium Declaration. Responsibility for coordinating the summit was assigned to the ITU guided by a high level organizing committee of representatives of UN agencies.

The process, in which representatives of governments and intergovernmental agencies were well versed, consisted of a series of preparatory committee meetings, or PrepComs, plus regional meetings in various parts of the world.^[2] A number of UN agencies, including UNESCO, organized consultative meetings and many organizations held conferences or meetings on specific questions. During the first phase, they included the “Pan-Arab Regional Conference on WSIS” on June 16–18, 2003 in Cairo (Egypt), the World Information Technology Forum, August 27–29, 2003 in Vilnius (Lithuania), the World Summit of Cities and Local Authorities on the Information Society on December 4–5, 2003 in Lyon (France), and the conference on “The Role of Science in the Information Society” which was organized by the European Organization for Nuclear Research and held in Geneva (Switzerland) on December 8–9, 2003, immediately before the first WSIS summit meeting.

In the first phase, these activities were focused on identifying the issues of concern and ways of addressing them. The issues, underlying and guiding principles, and strategies for addressing both were codified into a *Declaration of Principles*^[3] and a *Plan of Action*^[4] by government representatives during the extended PrepComs in order to

finalize agreed documents before the formal Summit meetings at which set speeches would be made by heads of government, senior ministers, or their representatives. In the second phase, similar activities aimed to develop some momentum to achieve the agreed goals by the UN Millennium deadline of 2015, again formulating an agreed plan, the *Tunis Commitment* and the *Tunis Agenda for the Information Society*,^[5] through negotiation in the PrepComs.

In both phases, a number of major concerns and the intransigence of some governments threatened to derail the process. Despite the efforts of the presidents of the PrepComs and behind the scenes negotiations, both preparatory processes came down to the line, with agreement secured very late during the night preceding the opening of the summit meeting. In the first phase, the third and final PrepCom was not concluded in September 2003 as planned, and despite an Intersessional Meeting held in Paris in July, but it had to be reconvened in Geneva on November 10–14 and again December 5–6, only concluding late on December 9. In the second, a “Group of Friends of the Chair” was used to try to smooth the process, but nevertheless the third PrepCom held in Geneva on September 19–30 had to be reconvened on the eve of the summit in Tunis November 13–15.

ROLE OF CIVIL SOCIETY

The WSIS process and documents recognized the tripartite—“multistakeholder”—interests of governments, civil society, and business entities, taking the central role of the intergovernmental agencies for granted. Space was made available and some logistical and administrative support was provided to civil society and business entities. That recognition of nongovernmental stakeholders was instituted in accordance with the UN resolution but was an unprecedented innovation for a UN sponsored summit. It went well beyond the involvement permitted to business and nongovernmental organizations during previous summits such as the World Summit on Sustainable Development held in Johannesburg in 2002. But, welcome as it was, the multistakeholder approach was somewhat grudgingly accepted by many of the governmental delegations which clearly regarded themselves to be “more equal” than the other elements of the process, in keeping with their traditionally central role in international negotiations. Crucially, the capacity to intervene vigorously in the process was severely constrained because opportunities to speak in the formal PrepComs were largely limited to governments and intergovernmental organizations, especially those of the UN system but including the Bretton Woods organizations such as the World Bank. Interventions by business entities and civil society

organizations were restricted to 15 min. slots once or twice a day; slots in which the myriad organizations had to vie for opportunities to make 2–3 min addresses.

Nevertheless, civil society took full advantage of the opportunities provided. “Civil society” is a misnomer: it is the term employed by the UN agencies for the broad coalition of nongovernmental organizations (NGOs), which represented the many dimensions of civil society in the WSIS process. They extended from globally active transnational social movement organizations such as Greenpeace to localized NGOs including the Computer Association of Nepal to professional peak bodies such as the International Federation of Library Associations and Institutions (IFLAs). Many very different organizations with very different agendas, structures, and capabilities were trying to influence the process and outcomes. Their concerns ranged across many domains from feminist issues, environmental concerns to broad human rights agendas. Most were concerned about redressing inequity, especially the digital divide and its consequences, and the inequalities between developed and developing countries, urban and rural populations, and mainstream and marginalized peoples.

The civil society organizations demonstrated a remarkable capacity to self organize with guidance from the Conference of NGOs in Consultative Relationship with the UN (CONGO), a vehicle for NGOs which wish to interact with the UN and its agencies. Regular meetings of participating civil society organizations were held under the aegis of the Civil Society Bureau during the PrepComs and other meetings and a number of thematic caucuses and working groups were established, such as “Education and academic,” “Cultural and linguistic diversity,” and “Persons with disabilities.” Reflecting the level of leadership which emerged from the groupings, some appeared to work quite well, others struggled to find a common voice. Although they were a useful device to focus discussion on specific domains of concern, so that key issues and draft phrases for documents could be identified, the thematic groupings poorly served organizations with wide interests but limited resources such as IFLA.

“Business entities” participating in WSIS largely comprised peak bodies representing business interests although some powerful companies such as Microsoft were individually influential. Offered the same support and opportunities as civil society organizations, business entities showed less capacity or interest in self-organization and appeared to focus on key issues of importance to them individually with little apparent coordination. Their participation was most visible during the formal summits in Geneva and Tunis where extensive trade exhibitions, ICT4All, were held.

In contrast, civil society organizations showed remarkable unanimity, putting aside their differences and specific

concerns in the shared interest of emphasizing the big issues. They achieved considerable success but were often frustrated by the attitudes of most government delegations who clearly felt that international negotiations were their province and resented the involvement of other parties. The concerns and frustrations of the civil society sector in the WSIS process were expressed in an alternative civil society declaration which was agreed and issued during the Geneva Summit.^[6]

THE ISSUES

Effective access to information, knowledge and communication technologies for all, and especially people in developing nations, was the key issue identified in the UN resolution. Consequently, the desired outcomes were initially considered to fall essentially in the technological realm. For that reason and because the host organization was the ITU, responsibility for participation in the WSIS processes was assigned by most governments to ministries of communications, information technology, and similar areas. Thus, the governmental representatives who advised and worked with the nations' accredited diplomatic representatives to the UN in Geneva came mainly from such ministries and focused on the primary, largely technological, concerns of those ministries.

That technologically deterministic approach to the information society characterized early discussions. Challenging that orientation and seeking to introduce other issues—social, cultural, linguistic, gender, environmental, etc.—then became the first and major obstacle that civil society organizations, international agencies with broader priorities, and some likeminded governments had to surmount. UNESCO, for example, took an early lead by organizing four thematic meetings at its Paris headquarters in February 2002 to begin to draw up an agenda on educational, scientific, social, and cultural matters which should be raised in the WSIS processes.^[7]

Setting the common vision of the information society on a firm and unqualified foundation of agreed fundamental human rights principles, as a just and fair information society for all, became the second major challenge. The crucial importance of establishing that foundation was fiercely advocated by the coalition of civil society interests and forcefully promoted by many governmental delegations, including especially those of the European Union. It was, however, opposed by some which sought to qualify such rights by asserting the supremacy of governments.

The Group of 77,^[8] an alliance of developing nations which seeks to advance their economic interests through collaborative advocacy, argued strongly that a major focus on development was an essential key to creating an information society for all. The Group emphasized both the need to prioritize development and to resource it. Achievement of this third key element was vigorously

supported by the civil society organizations but did not appear to be a priority for the business sector. All government delegations expressed support for development as a desirable goal but differed on the means of achieving it.

The major technological questions came fourth and were not strictly technological in nature but rather contextual factors which would condition technological developments. Primary among them was the question of governance of the Internet, a question which placed the U.S. representatives in opposition to most other governmental representatives and divided opinion among civil society organizations.

LIBRARY AND INFORMATION SECTOR INTERVENTIONS

As the peak international organization for libraries and information services, the IFLAs, strove to highlight the central role of libraries and information services “at the heart of the information society.” International Federation of Library Associations and Institutions embarked on its most extensive advocacy campaign ever to try to ensure that the sector's concerns, including freedom of access to information and the digital divide, would be recognized in the WSIS outcomes. International Federation of Library Associations and Institutions representatives worked with cognate peak professional bodies such as the International Publishers' Association, participated in consultative meetings, accredited delegations to the PrepComs, and organized conferences before each summit meeting. Formal submissions, statements on key issues, and a booklet of library success stories were produced and used in lobbying in the WSIS processes and in home countries.^[9]

These interventions, which extended from the UNESCO meeting in early 2002 to the Tunis summit meeting at the end of 2005, demanded an intense period of focused activity by IFLA staff, members of the Governing Board, and library representatives from many nations, including notably a team of Swiss librarians and students who provided essential logistical support and representation in Geneva. Also important was the strong support provided by a number of national delegations, especially the representatives from New Zealand, which articulated the sector's concerns in preparatory meetings in which civil society representatives, including those from IFLA, were not permitted to speak. The campaign demonstrated the need for IFLA to establish an effective advocacy capability while still drawing on the knowledge, persuasiveness, and contacts of members.

During the first phase, the *Libraries @ the Heart of the Information Society Pre Summit Conference* was crucial in providing an opportunity for librarians to gather in the General Assembly Hall of the Palais des Nations in Geneva (Fig. 1) a month before the summit meeting to highlight the centrality of library and information services to the information society and to meet with members of

Fig. 1 Libraries @ the Heart Pre Summit Conference, Geneva, December 2005.

their governments' delegations. More than 70 countries were represented at the Conference, and in many cases discussions with governments continued in national capitals. Delegates called upon the nations of the world to:^[10]

Support and extend the existing global network of library and information services to make available and preserve knowledge and cultural heritage, to provide information access points and to develop the twenty-first century literacies which are essential to the realization of the information society. High quality library and information services provide access to the information required by the communities they serve: a modest investment in them would quickly return significant dividends.

Those interventions within the WSIS processes were echoed by initiatives taken by a number of national library associations within their own countries. For example, the participation of IFLA President Kay Raseroka in a meeting organized by the Danish Library Association and other Danish NGOs lead to the inclusion of library views in the Danish government position which was presented at PrepCom3. Other library associations and national libraries sought to interact with the responsible ministries and, in some cases, were successful in gaining representation in the governmental delegations.

The library and information service sector argued that libraries and information services serve as gateways to knowledge, thought, and culture for individuals and groups and promoted the benefits of lifelong literacy, as the range of competencies necessary to engage fully with the Information Society. A broader vision was also expressed, a vision based on the right to both access and express information without restriction in which

libraries and information services contribute to the development and maintenance of intellectual freedom and help to safeguard democratic values and universal civil rights.

Advocacy continued in the same vein during the second, Tunis, phase but with increased emphasis on demonstrating practical outcomes. The success stories list was redeveloped as a database and libraries and information services were encouraged to submit local examples of good practice. Another presummit conference was held, *Libraries: the Information Society in Action*, at the Bibliotheca Alexandrina in Alexandria, Egypt on November 10–11, 2005. Highlighting the importance of information literacy, this conference was held in conjunction with a UNESCO supported to *High Level Colloquium on Information Literacy and Lifelong Learning*. Communiqués from both conferences were used at the summit meeting in Tunis the following week at which IFLA gained a rare invitation to give a plenary address.^[11]

OUTCOMES

After all the negotiation and brinkmanship, a compromise *Declaration of Principles* was agreed. It has three parts: a statement of shared vision about the developing information society; a list of key principles to underpin the developing information society; and, a summary of the processes which will lead the world's peoples toward an equitable information society.

At its outset, the first part "Our Common Vision of the Information Society," places people, their rights and

inclusiveness at the heart of the information society but also highlights sustainable development and a global focus. The vision then identifies the transformative potential of information and communication technology (ICT) to promote the eradication of extreme poverty and hunger and achievement of a range of other contemporary international priorities including the empowerment of women, reduction of child mortality, elimination of diseases, promotion of environmental sustainability, and creation of global partnerships for development. This section reads as an affirmation of faith in technocratic management through the effective use of ICTs.

The Declaration then turns to human rights and fundamental freedoms, proclaiming their universality, and reaffirming without qualification the right to freedom of opinion and expression stated in Article 19 of the Universal Declaration of Human Rights. It asserts that this is “an essential foundation of the Information Society.” The inclusion of this unqualified statement, despite the resistance of several nations, represented a major success for civil society and the governments which advocated the inclusion of this principle. The vision ends with recognition of its ambitious nature and introduces as new term to characterize the required commitment, “digital solidarity.”

The second part identifies 11 key principles “for building an inclusive Information Society”:

1. The role of governments and all stakeholders in the promotion of ICTs for development.
2. Information and communication infrastructure: an essential foundation for an inclusive information society.
3. Access to information and knowledge.
4. Capacity building.
5. Building confidence and security in the use of ICTs.
6. Enabling environment.
7. ICT applications: benefits in all aspects of life.
8. Cultural diversity and identity, linguistic diversity, and local content.
9. Media.
10. Ethical dimensions of the Information Society.
11. International and regional cooperation.

Some of these are indeed principles, others expose the compromise nature of the Declaration and some of its undercurrents, including the discomfort of governmental delegations with the recognition accorded to civil society organizations and concerns about security and control.

The *Declaration of Principles* was accompanied by a *Plan of Action* which assigned responsibilities for implementation of the agreed aims largely to governments but with some priorities in the province of intergovernmental agencies. Although earlier versions of the plan had identified a number of intermediate target dates, the final version placed the deadline at 2015, as for the UN Millennium Declaration.

The Tunis summit meeting, 23 months later, was intended to encourage the implementation and offer some early examples of success. It reaffirmed the outcomes achieved in Geneva and promoted concerted action toward 2015 in the *Tunis Commitment* and the *Tunis Agenda for the Information Society*. Major issues during this phase included the lack of progress in regard to Internet governance and recognition of the Digital Solidarity Fund and continuing concern at the reluctance of some governments to support unqualified recognition of human rights as an essential foundation for a just and fair information society. This last concern was heightened by the holding of the second summit meeting in Tunisia which, in the view of many especially from civil society organizations, had a repressive government. That view was confirmed during the summit meeting when a large police and military security force attempted to prevent the open expression at a number of events.

Despite sharing these concerns, the library and information sector and IFLA in particular was well pleased with the WSIS outcomes.^[12] Although not always accorded the sector's priorities, all its principal issues were included in the declaration and action plan. And it was recognized that, for the first time at a global level, governments had devoted considerable time to discussing and agreed on the core concerns of libraries and information services.

UNFINISHED BUSINESS

The compromise agreed in Geneva and reiterated in Tunis had secured the unqualified recognition of human rights but left two major issues unresolved. A most contentious issue lay in the governance of the Internet, a question ultimately of control. To date, the successful development and growth of the Internet has been overseen by the Internet Corporation for Assigned Names and Numbers, a not-for-profit company registered with the U.S. Department of Commerce.^[13] Some governments were uncomfortable at the possibility of interference by the U.S. government; many of the developing nations felt that they needed more influence; and some repressive governments wished to exert more control. Some suggested oversight by an international agency, possibly the ITU or a new agency, but the U.S. government and business representatives wished to continue to apply a market model. Civil society representatives sympathized with the developing nations' view, but largely felt that the current model had served the global community well and were consequently doubtful about the merits of change. In the event, this dilemma could not be resolved in Geneva or Tunis. It was referred to the Secretary-General of the UN who was requested to establish a working group, the Internet Governance Forum, to seek a solution.

The other main issue which provoked deep division in Geneva was a proposal by the President of Sénégal to

establish a “Digital Solidarity Fund” which would help to reduce the digital divide. This proposal was soundly condemned by the richer nations, led by the European Union. They argued that there were many other international sources of funding that should be tried first and stated their absolute opposition to the creation of such a fund. Representatives from developing nations and many from civil society interpreted this position as an unwillingness to take urgent and decisive action to reduce inequality. Further discussion in the Tunis phase resulted in grudging acceptance but little commitment to the fund.

For libraries and information services, these outstanding issues and others which were somewhat blurred in the compromise are significant and will require continuing action. However, the achievement of satisfactory, albeit compromise, outcomes outweighed any deficiencies. If the WSIS processes had collapsed, as appeared possible in Geneva, the cause of recognizing the importance of promoting a just and fair information society for all and, specifically, the sector’s priorities would have suffered a major setback.

CREATING THE “INFORMATION SOCIETY FOR ALL”

The UN General Assembly endorsed the outcomes of the WSIS without a vote on March 27, 2006. The resolution welcomed the strong orientation toward development and the progress achieved toward “a multistakeholder approach to building a people centered, inclusive and development-oriented information society.”^[14] Signaling the success of advocacy by developing countries, the Assembly also endorsed the Digital Solidarity Fund which it cast as a means of securing voluntary sources of “solidarity” financing to support the transformation of the digital divide into digital opportunities for developing countries. Responsibility for oversight of implementation was assigned to the Economic and Social Council and the Secretary-General was requested to convene the Internet Governance Forum.

CONCLUSION

By linking its outcomes to the UN Millennium Declaration, WSIS proclaimed that the creation of an equitable information society for all must be a global priority for the twenty-first century and that its attainment would require concerted action by all nations, the business sector, and civil society. A half century after the endorsement of the Universal Declaration of Human Rights, the summit affirmed that the global information society should be based on those agreed rights, especially the right to express and access information and should seek to redress inequality.

This was a watershed for organizations concerned with information and knowledge management because it placed information and knowledge—its creation, sharing, curation, and use—at the core of the desired new global society. The WSIS outcomes, agreed by all governments and endorsed unanimously by the United Nations, provide a strong foundation for the proliferation and further development of libraries and information services, but the process and outcomes also demonstrated the vital importance of effective and continuing advocacy in partnership with like-minded organizations.

World Wide Web (WWW)

Christinger Tomer

School of Information Sciences, University of Pittsburgh, Pittsburgh, Pennsylvania, U.S.A.

Abstract

The World Wide Web (WWW) is a system for creating, organizing, and linking documents so that they may be easily browsed. The Web has transformed the ways in which we communicate, learn, and socialize, and it has changed the ways in which we think about information, information seeking, and interacting with information systems. It is, moreover, one of the principal factors underlying globalization, in the process creating a vast array of connections involving individuals, groups, and institutions and providing a platform that has redefined workflow in many organizations through computer-to-computer data interchanges as well as the creation of collaborative communities. The Web has succeeded because of the following: (1) many relevant conditions were “right” and (2) it has relied from the outset on a simple, derivative architecture, consisting of the Hypertext Markup Language (HTML), the Hypertext Transfer Protocol, and the Uniform Resource Locator. The Web’s stewards have managed the continuing development of the underlying technologies to ensure its openness and in ways that have led to gradual changes and subtle transformations, rather than radical shifts. At the same time, the Web’s stewards, most notably the World Wide Web Consortium, have fostered important innovations, such as the development of the Extensible Markup Language and the Cascading Style Sheets specification, the proposal to develop the “Semantic Web,” and the evolution of HTML leading to the development of HTML5. In the process, the World Wide Web has had profound effects on libraries, librarians, and library users, changing the way in which librarians relate to vendors, clients, bibliographic utilities, and other libraries and giving rise to new, often highly creative approaches to serving readers.

INTRODUCTION

The World Wide Web is a system for creating, organizing, and linking documents so that they may be easily browsed. Created by Tim Berners-Lee, the World Wide Web is also one of the most remarkable developments of the last 25 years, and it is virtually certain that it will continue to be a pervasive influence on both information producers and information consumers for the foreseeable future.

The Web has transformed the ways in which we communicate, learn, and socialize. Perhaps even more to the point, the World Wide Web has changed the ways in which we think about information, information seeking, and interacting with information systems.

The World Wide Web may be an incomplete and imperfect manifestation of the ideas about hypertext that Ted Nelson set forth in the mid-1960s, but it has changed the ways in which we think about the world, and it has changed forever how ideas, information, and knowledge are shared.^[1] According to Thomas Friedman, in his *The World Is Flat: A Brief History of the Twenty-First Century*, the World Wide Web is one of the principal factors underlying globalization, in the process creating a vast array of connections involving individuals, groups, and institutions and providing a platform that has redefined workflow in many organizations through computer-to-computer data interchanges as well as the creation of

collaborative communities. As Friedman has also noted, it is an environment that seems almost ideally suited to the needs of information seekers with what he calls a high “curiosity quotient”—Friedman believes that when curiosity is combined with passion in the exploration of a subject of interest, an individual of average intellectual endowment may be able to acquire knowledge comparable to that of a highly intelligent person, because of the vast amount of information resources available through the Internet—and it clearly appeals to writers in search of new and more expressive modes of communication.^[2] For them, documents are, as Lisa Gitelman has observed, “instruments used in the kinds of knowing that are all wrapped up with showing, and showing wrapped up with knowing,” and the Web affords both technologies and cultural milieus of greater power and scope than traditional, analog forms of information exchange.^[3] The product, from the perspectives articulated by Timothy Morton, are often “hyperobjects,” by which Morton means objects so massively distributed in time and space that they transcend “spatiotemporal specificity.”^[4]

Less flattering are the views of critics like Louis Menand, who has characterized the Web as an imaginary space—he calls it a “spatial imaginary”—in which visual change is often experienced (and confused with) as a physical change. Menand argues that the use of “real estate vocabulary,” in the form of terms such as “address,”

“site,” and “domain,” reinforces this dislocating illusion and changes how we think about information resources and use them in ways that obscure underlying realities.^[5]

The emergence of Web 2.0, a new layer of activities shaped by participatory architectures based on cooperation rather than control, lightweight programming models, enriched user experiences, and a fuller realization of the Internet as a platform for computing, changed yet again the way in which we think about and use the Web and its contents. In its first phases, Web 2.0 allowed users to comment on published articles; participate in social networks; tag items such as digital photographs, images, and documents; and share Web bookmarks.^[6] In the second phase of Web 2.0, software as a service came to maturity, through the integration of application programming interfaces (APIs), Ajax programming using JavaScript and the Document Object Model (DOM), and cloud-based storage, in the form of Web-based applications such as Google Docs, YouTube, and Microsoft Office 365.

More recently, Hypertext Markup Language 5 (HTML5), a synthesis of HTML and XHTML that integrates the DOM into the markup language and offers new opportunities for the incorporation of audio and video media, has further enhanced what may be conveyed through a Web page. It includes processing models designed to encourage more interoperable implementations, extends and improves the markup available for documents, and introduces markup and APIs for complex web applications.^[7]

Looking to the near future, it seems likely that the ideas associated with the Semantic Web will soon begin to have more obvious effects, transforming the Web from a vast file system to an equally vast database capable of supporting various processes, including discovery and search, with perhaps unparalleled precision.

The Semantic Web has long been a controversial subject, marked by high aspirations and serious doubts. The debate began the day Berners-Lee, James Hendler, and Ora Lassila unveiled their proposal, focusing mainly on questions about its feasibility.^[8] There were almost no doubts expressed about the desirability of this vision for the future of the Web, but many experts were not optimistic about the success of the initiative, owing to its complexity and its stringent requirements and, as Clay Shirky observed, because most of the data we use are not amenable to the syllogistic recombination that the Semantic Web presumes.^[9] Others have noted, similarly, that the proposal “disregards the fundamental fuzziness and variability of human communication” and that the “rigid formality” that characterizes the Semantic Web cannot be enforced or ensured, resulting in an “interoperative polyglot” akin to, for example, RSS (Rich Site Summary or Really Simple Syndication).^[10]

However, the vision of a near future in which semantically oriented technologies that systematically describe the content of the Web are coupled with artificial

intelligence to create a new layer within the Web infrastructure has persisted.^[11] More important, essential parts of this new infrastructure have been built, and the transformation, in which metadata in standardized forms pervades the network and affords the basis for a wide array of services, ranging from more precise retrieval of information to the automatic generation of documents, is well under way.

But the doubts persist. In 2010, the Pew Internet Research Center surveyed a group of experts on Web technologies in an effort to understand the prospects of the Semantic Web. Some of the experts, 41% of the survey’s 895 respondents, thought that the concepts on which the Semantic Web is founded would be realized by 2020, while 47% of those surveyed expressed skepticism about its feasibility, agreeing with the notion that “[b]y 2020, the semantic web envisioned by Tim Berners-Lee will not be as fully effective as its creators hoped and average users will not have noticed much of a difference.”^[12]

Around the same time, Berners-Lee returned to the debate, arguing then and later that efforts to mark up and link datasets, but especially datasets derived from scientific research, would lead inexorably to a new version of the Web organized on the basis of semantic information interpreted by both humans and computers.^[13]

Another aspect of Berners-Lee’s vision for Web is the annotation. It is a feature that Berners-Lee had originally intended to incorporate, but in the effort to retain control over the technology and guarantee its openness in the mid-1990s, it was set aside. But when he wrote *Weaving the Web* in the late 1990s, Berners-Lee noted that “[w]e need the ability to store on one server an annotation about a Web page on another [server].”^[14]

In recent years, the idea of creating a standard for annotations and integrating it into the Web infrastructure has been taken up by the World Wide Web Consortium (W3C) and others, in the form of Open Annotation Data Model. The primary aim of the Open Annotation Data Model is to create a “single, consistent model,” within “an interoperable framework for creating associations between related resources, annotations, using a methodology that conforms to the [a]rchitecture of the World Wide Web,” and in so doing provide “a standard description mechanism for sharing [a]nnotations between systems, with the mechanism facilitating sharing or migration of annotations between devices.”^[15]

There is considerable interest among developers in the annotation as a mechanism for information enhancement and exchange, manifest in a variety of projects active at this writing. But it is not clear if there is a widespread interest among users. Other projects of similar purpose, such as the W3C’s Annotea Project, have met with limited success.^[16] Perhaps even more to the point, there is no sufficiently simple mechanism for support of the Open Annotation Data Model that is available for deployment; so, the model and its potential remain untested at this writing.

HOW BIG IS THE WEB?

Since the World Wide Web does not operate under any central authority, the question of the Web's size is difficult to answer precisely. Domain name system (DNS) services, the Internet services that translate domain names into IP (or Internet Protocol) addresses, list the domain names that exist, but not every domain contains a website; many domains contain more than one website, and DNS registrars are not obliged to report how many domains their databases contain. So most of what is known about the size of the World Wide Web is based on survey results, which differ substantially, and/or the number of pages indexed by Web search engines, such as Google and Yahoo. However, within the limits of what can be measured, there is evidence not only that the Web continues to grow at a rapid rate but also that it is taking on increasing complexity and substance in the content it transports.

The Internet has been growing exponentially since at least 1993. Current estimates indicate that slightly more than a billion live websites have been created since 1991. Today, there are at least 760 million websites, with approximately 103 million new sites added in 2013 alone. How many of the current websites are active? The number depends on how "active" is defined. One source indicates that 67% of the current sites are active, while another suggests that about three-quarters of the active sites are "parked," or dormant.^[4]

According to the findings of surveys last updated in 2014, there are 2.7 billion Web pages that have been indexed and approximately 2.6 billion Web users. Current estimates indicate that slightly more than a billion live websites have been created since 1991 and that there are roughly 672 million websites in existence, with about three-quarters of them dormant (or "parked").^[4] (This finding is largely consistent with the results of a series of studies conducted by OCLC between 1997 and 2003, in which investigators discovered that perhaps as many as half of the websites on the Web had effectively been abandoned by their respective owners.^[17])

Active sites present a total of 14.3 trillion pages, 48 billion of them indexed by Google, and consist of a total of 672 exabytes of accessible data. More than 2 trillion searches were conducted through the Google search engine in 2013, by an estimated 1.45 billion users.^[18] (Another source indicates that the number of Web users is much larger, in excess of 2.5 billion people.)^[19]

In principle, the World Wide Web remains an open and egalitarian enterprise. Anyone can launch a website, but the vast majority of the top 100 websites, the most visited sites, are run by corporations, the most important (and almost only) exception being *Wikipedia*.^[20]

The so-called deep Web, the part of the Web that is not indexed by search engines, which is generally restricted in its access and which may include non-HTML, unlinked, dynamic and/or scripted content, is thought to be much

larger than the "surface Web." Recent estimates suggest that the "deep Web" may make up as much as 90% of the Web, but the size and continuing growth of the Web make it impossible to determine precisely how large it is or how much of it is part of the "surface Web" or the "deep Web." However, according to Bright Planet, an organization that specializes in content extraction, the "deep" or "invisible" Web contains nearly 550 billion individual documents, as compared to the one billion documents contained within the "surface Web."^[21]

Almost 60% of the Web's users are employing mobile devices, that is, smartphones and tablets. The popularity of various Web browsers is a matter of constant contention, but it appears that Internet Explorer remains the most popular Web browser at this writing, with a combined market share of 49%. Google Chrome has a market share of 18%, and Mozilla's Firefox browser and Apple's Safari each have shares of approximately 11%.^[22,23]

According to the HTTP Archive, the average page is currently 1890 KB in size, compared to 828 KB in May 2012, with an annual growth rate of about 50%.^[24,25] Images typically make up about 55–60% of the overall payload. The use of Cascading Style Sheets (CSS) and JavaScript is increasing, whereas the number of requested pages including Adobe Flash is slightly below 30% and declining markedly.^[26]

It is not entirely clear why Web pages are growing in size and complexity. It seems reasonable to assume, however, that there are several highly influential factors. The first is increasing penetration of broadband Internet services, which allow the creators of Web content to create and transfer files of substantial size with ease. Moreover, the widespread availability of broadband services, particularly in the developed world, means that many files with richer content can reach large audiences quickly and without difficulty. A second factor is competition. Competition for the attention of Web users, but particularly for consumers using the Web as a marketplace, is intense, and there is evidence that richness of content is often a necessary condition for success. Finally, there is the availability and use of authoring and site management tools that make it relatively easy to create HTML and/or XML documents of considerable complexity, and to be able to do so without detailed knowledge of the relevant coding languages.

Another major factor adding to the complexity of the Web is the use of streaming media, which has increased by more than 100% each year since 2000. Audio or video files that are transmitted continuously from a server can begin playing as they are being downloaded to a computer. This process is now enhanced by the Dynamic Adaptive Streaming over HTTP (DASH) standard, which has made video-on-demand a "standard" Internet application similar in its impact to e-mail and Web browsing.^[27]

While videos account for only a small percentage of the responses from Web servers, the most popular video services, Netflix, YouTube, Amazon Video, Hulu, and

iTunes, generate between 50 and 55% of the bytes transferred via the Web, with Netflix producing slightly more than 31% of the traffic in 2014 and YouTube accounting for about 12% of the overall traffic.^[28]

Interest in downloading or streaming videos via the Web is likely to continue to grow in accord with broadband's market penetration and the increases in the speed of data transfer that are now an integral part of the market for Internet services and with improvements in the DASH protocol and end-to-end congestion controls. So, it seems reasonable to assume that the demand for videos will continue to grow, perhaps even sharply, and that the bandwidth required to fulfill those requests will continue to be a major factor in the use of the Internet, the management of Internet backbone resources, and the politics of the Internet.

Is the Web getting faster? Google claims that it is significantly faster today than it was only a couple of years ago, owing mainly to improvements in the core infrastructure, much faster mobile networks, and improvements in Web browser design.^[29] However, there are other sources that dispute such findings, but resolution of the question is not possible at this time, because there is no consensus about the methods of measurement or analysis.^[30]

A BRIEF HISTORY OF THE WORLD WIDE WEB

The development of the World Wide Web may be divided into three phases. In the first experimental phase, Berners-Lee developed a collaborative hypertext environment based on an adaptation of the TCP/IP protocol and aspects of Standard Generalized Markup Language (SGML). As noted in his original proposal, "the working structure of the organization is a multiply connected 'web' whose interconnections evolve with time."^[31] Berners-Lee then made the source code available over the Internet, facilitating experiments with and improvements of the basic technologies, a process that continues to this day largely through the W3C.

According to the *Encyclopedia of Computer Science*

Hypertext is both the concept of interrelating information elements (linking pieces of information) and the name used to describe a collection or web of interrelated or linked nodes.^[32]

Vannevar Bush is generally given credit for developing the idea of hypertext, as first articulated in an article entitled "As We May Think," which was published in the July 1945 issue of *The Atlantic Monthly*.^[33] However, recent research indicates that the ideas set forth by Bush were not new and that the idea of a machine that would connect an individual to diverse sources of information and effectively help to synthesize such information had also been expressed previously, perhaps most notably by H.G. Wells

in his pre-WWII lectures on *World Brain*, by Paul Otlet, a Belgian bibliographer who proposed in 1934 a plan for a global network of "electric telescopes," which would allow anyone in the world to access to libraries of books, articles, photographs, audio recordings, and films, and by Emmanuel Goldberg, who patented a device called the "Statistical Machine" in 1927 that allowed a user to search and retrieve large volumes of data stored on microfilm by using a so-called search card and who later proposed a technique that would allow a user to enter a query via telephone.

Bush called his machine the "memex." Wells talked about an interactive encyclopedia controlled by subject experts that would function as a form of collective intelligence. He wrote the following:

[W]hat I am saying . . . is this, that without a World Encyclopaedia to hold men's minds together in something like a common interpretation of reality, there is no hope whatever of anything but an accidental and transitory alleviation of any of our world troubles.^[34]

Otlet called his knowledge network the Mundaneum. (Previously, Otlet and Henri La Fontaine had launched a project called the Universal Bibliography, or *Répertoire Bibliographique Universel*, a plan to catalog of all the world's published information. The project eventually resulted in the creation of more than 15 million entries, stored on index cards and classified under a system called the Universal Decimal Classification, an adapted version of the Dewey Decimal System.)^[35]

In considering the history of hypertext, scholars tend to focus on the various mechanisms that were proposed as ways of bringing greater order to the formal communications of scholars and affording greater precision in the use of such materials, and in the process may not always pay enough attention to Bush's notion that memory is an associative process, and that we should build information storage and retrieval systems whose organizing structures mimic associative memory as closely as possible. So, in Bush's mind, the linking functions that connected chunks of text and articles to one another, what we now call hypertext links, represented the best available way to imitate this aspect of human memory. (This was not a new concept; in fact, the notion can be traced back to Aristotle, whose thoughts about memory and recollection may be viewed as the first articulation of principles of association and order. Bush's greater service was bringing these ideas into discussions about how to make information systems more effective, and by suggesting that "spatializing" ideas, or the chunks of text, data, and imagery, into more discrete units of presentation could enhance memory and recollection.^[36])

Similarly, the idea of a "world brain" as set forth by Wells may sometimes be dismissed too quickly, in part because Wells was vaguer than, say, Otlet or Bush, about

how his system might work at a mechanical level, but also because he used an ancient and familiar form, the encyclopedia, as the basis for his proposal. What gets lost are Wells' insights into the sociology of knowledge production; specifically, his recognition of science as a highly collaborative enterprise and his sense that technology, in the form of a distributed network, could enhance and extend the process known as "peer review," and thereby bring greater order and clarity to human knowledge.

There were a number of experiments with hypertext from the mid-1960s through the end of the 1980s, including Ted Nelson's Xanadu Project, whose goal was the creation of a computer file system based on hypertext concepts and Douglas Engelbart's NLS/Augment, the first distributed, shared-screen, collaborative hypertext system in 1968. Other prototype and commercial hypertext systems appeared in the 1970s and 1980s, including Document Examiner, gIBIS, Guide, Hypergate, HyperTIES, Intermedia, MacWeb (by LIRMM), Max, Neptune, NoteCards, PHIDIAS, StorySpace, Writing Environment, and ZOG/KMS. (In June 2014, 54 years after first announcing the Xanadu Project, Nelson finally released a prototype of his system, which may be viewed at <http://xanadu.com/xanademos/MoeJusteOrigins.html>. According to information on Nelson's website, he believes today that the Xanadu document format could supplant PDFs but is unlikely to displace the basic architecture of the World Wide Web.)^[37]

One hypertext system, Apple's HyperCard, which was based on the idea of virtual "cards" in a stack akin to a Rolodex and a scripting language called HyperTalk, came into widespread use as part of the package of applications developed for and included with Apple's Macintosh computer. But HyperCard was never fully adapted for use in networked environments or recompiled to run under OS X, and Apple ceased work on its development during the transition to the OS X operating system, eventually dropping it altogether in 2004. It has been argued, moreover, that HyperCard was not a genuine hypertext system, because it lacked many of the navigation, annotation, and structural features that characterize "true" hypertext systems. But, true hypertext system or not, by the time the powers that be at Apple had lost interest in HyperCard, another initiative, developed by Tim Berners-Lee and eventually known as the "World Wide Web," had taken hold, changing forever the Internet and how we think about computerized text.

In 1989, Tim Berners-Lee was working as a software engineer at CERN, the European Organization for Nuclear Research. (The name CERN is derived from the acronym for the French "Conseil Européen pour la Recherche Nucléaire," or European Council for Nuclear Research, a provisional body founded in 1952 with the mandate of establishing a world-class fundamental physics research organization in Europe.) Scientists working at CERN used all sorts of operating systems and software on their

computers, and as a result, one scientist often could not find or access another scientist's research, but then, Berners-Lee noticed

All these systems looked different but in fact you're reading stuff on a screen and sometimes clicking on bits. So you could imagine a thin layer which would map all these existing systems into one virtual system. Wouldn't that be cool?^[38]

Berners-Lee's supervisor at CERN thought the idea was vague but worth exploring, so he commissioned Berners-Lee to create a system for collaborative authoring and document sharing that could run over the local area network at CERN and entail a number of different types of computers and operating systems.

To make such a system operational, Berners-Lee needs to create a mechanism for the transport of textual data and a document format that could be interpreted by all of the operating systems that would be connected across the CERN network. And because he was interested incorporating ideas about hypertext into the system, he needs to establish a way of creating links within and among documents. According to Berners-Lee

The idea of the Web was prompted by positive experience of a small "home-brew" personal hypertext system used for keeping track of personal information on a distributed project. The Web was designed so that if it was used independently for two projects, and later relationships were found between the projects, then no major or centralized changes would have to be made, but the information could smoothly re-shape to represent the new state of knowledge.^[39]

Owing to the requirements of his assignment, the limited resources available for its support, and inspired by the success of the "home-brew" hypertext system, Berners-Lee elected to focus his efforts on the use of existing resources available to him under open licenses and/or technical standards. He realized almost from the beginning that the transport layer of his system could be built on top of the IPs—the so-called TCP/IP suite of rules for conveying data over the Internet—by adding a compatible layer, which he dubbed the Hypertext Transfer Protocol, or *http*.

Berners-Lee designed the HTTP to function as a request-response protocol under a client-server computing model, and he wrote the programming code for both a client and a server capable of carrying out the specified actions. In accord with this model, a client application, typically what we now know as a Web browser, submits a request message formed on the basis of the HTTP to a server that has been outfitted to recognize and respond to requests formatted in this way.

The key element of the request is the Uniform Resource Locator (URL). The URL is a specific character

string that constitutes a reference to a resource. The now-familiar components of a URL are

- The scheme, which defines how the resource will be obtained
- The domain name or numeric IP address of the destination location for the URL
- The port number
- The path specifying the location of the resource requested on the server

The URL may also include

- A query string containing data to be passed to software running on the server
- A fragment identifier, which, if present, specifies a part or a position within the overall resource or document

The server, which provides resources such as HTML files and other content or performs other functions on behalf of the client, returns a response message to the client, using another URL to route the response to the client. The response contains completion status information about the request and may also contain requested content in its message body.

In addressing the question of how the documents mounted on the server and fetched by the client would be formatted, Berners-Lee confronted a thornier problem, in part because the process of standardizing the formats for electronic documents was nascent. However, Berners-Lee discovered the SGML in the early going and recognized that under the SGML grammar a document is separated into three parts: (1) an SGML declaration; (2) a prologue; and (3) an instance, with the prologue constituting a document type definition (DTD). He noted further that the SGML declaration determines the lexicon of the grammar, specifies the document character set, and establishes the code positions associated with those characters, binding the abstract syntax of SGML to a concrete syntax expressed through the DTD. The concrete syntax formulated by Berners-Lee on the basis of SGML and the ISO standard defining the 7 bit coded character set for information interchange became known as the Hypertext Markup Language, or HTML.^[40,41]

So the HTML began as a subset, also referred to as a “document type definition,” of the SGML.^[42] As noted previously, Berners-Lee had been commissioned to create a system under which documents could be shared, edited, and annotated across a network, and the project required a way of formatting documents using a code base—ASCII (the American Standard Code for Information Interchange), as it happens—that was shared by a variety of computers and operating systems. Early on, Berners-Lee not only became aware of the SGML, but he also realized that SGML allowed for the creation of formatting subsets and related expressions rendered in ASCII.

The DTD Berners-Lee created was a simple expression, conceptually and syntactically. And that simplicity plays no small part in the success of the World Wide Web, because it is clear in retrospect that a more complicated scheme would have been much more difficult to implement or standardize. However, that same simplicity also became a curse of sorts, as it became clear that the wide variety of document types that authors sought to make available via the Web could not be supported adequately by a single DTD.

The system introduced by Berners-Lee provided a text-only interface. Acceptance of this system was slow. The text-only browser was not easy to use and the resources to which it had access were limited. However, that state of affairs changed in 1993, with the creation of a graphical Web browser for UNIX, known as Mosaic, by Marc Andreessen, an undergraduate student working at the National Center for Supercomputing Applications, and the distribution via the Internet of versions of Mosaic for Windows and the Mac OS in 1994. Mosaic’s introduction was the culmination of the first stage of Web development, and its effect was transformative. From the perspective of end users, the Web became a graphical medium, with Mosaic as the lens, and while it would take another 10 years before Web content began to achieve real richness and sophistication in visual terms, Mosaic was a clear indication of what was possible.

(In the early days of the World Wide Web, as programmers worked to develop browsers and other tools, questions about how to format HTML documents for presentation arose, and those questions became particularly acute with the development of graphical Web browsers such as Mosaic. Under SGML, formatting for presentation had been treated as a separate issue, with the focus placed instead on structural tagging. As graphical Web browsers came into more general use, one of the limits of this approach became obvious—most of the formatting of Web documents was being rendered by the browsers themselves and determined in large measure by the default settings of the specific browser in use. While permitting the browser to format the Web page had advantages, it also placed sharp limits on the extent to which the author of a Web page could control how that page was presented to a user. In the short term, the solution was to incorporate formatting attributes and tags into HTML, which in many ways adulterated the original concept. The longer-term solution came in the form of a compatible but distinct language for formatting, which came to be known as the “Cascading Style Sheets,” or CSS, specification.^[43])

In the second phase, the infrastructure that supports the Web through the present day was established. Jim Clark and Andreessen founded Netscape and released its Web browser in late 1994, ending the experimental phase in the Web’s development and initiating its commercialization. Microsoft, after ignoring the development of the Internet for a number of years, responded with the development of

a Web browser called Internet Explorer and the subsequent release of other, Web-related technologies, including the Internet Information Server. The Apache Project, dedicated to building secure Web server software in an open-source environment, was established in 1995. In 1999, as the Web turned from this “buildout” phase to a period of rapid expansion predicated on increasingly stable server technologies and more and more sophisticated approaches to document rendering, IBM embraced open-source software and played a key role in establishing the Apache Foundation, which has become one of the leading organizations in the ongoing development of the software that runs the Web. In 2001, the first podcast was presented (in the form of a Grateful Dead recording), Wikipedia was founded, and Pope John Paul II sent the first papal e-mail from a laptop in his office at the Vatican. In 2003, Apple’s iTunes music download service was launched. In 2004, Tim Berners-Lee was knighted, and Google became a public company.^[44]

In this “buildout” phase, one of the most critical developments was the introduction of the CSS specification in 1994. The purpose of CSS was twofold: First, it was intended to separate structural markup and formatting in order to simplify both coding and interpretation, and, second, it was designed to enlarge and enrich opportunities for formatting HTML documents, ranging from the ability to define families of fonts to absolute positioning and the use of so-called floats to wrap text around images to the cascade itself, which was defined as “the process of combining several style sheets and resolving conflicts between them.”^[45,46]

How important has CSS been to the development of the Web? Håkon Wium Lie, who wrote and published the first CSS specification in 1994, has asserted that CSS “saved HTML,” because it gave “authors a way to express their designs without adding new HTML tags.” Perhaps more to the point, CSS has afforded authors an effective mechanism separate and apart from structural markup for creating visually richer and more interesting Web pages.^[47]

In the third phase, which began in 2004–2005, the Web entered into a more highly interactive phase, characterized by network-resident applications, participatory architectures, the increasing use of XML-based technologies, and metadata interchanges that presaged the Semantic Web.

Under HTML5, yet another phase in the development was initiated. HTML5 provided a more coherent framework for the creation of Web pages and the development of Web applications. For example, whereas HTML 4 was imprecise in defining the structure of a document, HTML5 provides an “outline algorithm,” under which all content residing within the `<body>` of a document is also part of a section, and sections are defined explicitly within the `<body>`, `<section>`, `<article>`, `<aside>`, `<footer>`, `<header>`, and `<nav>` tags.^[48] In a related vein, under HTML5 headings, for example, `<h1>` and `<h2>` are defined and ranked within sections of the `<body>` of the

document. Relative ranking of the headings matters only within a section, with the structure of the sections determining the outline, and not the heading rank of the sections.

HTML5 supports video and audio tracks without plug-ins; provides programmatic access to a resolution-dependent bitmap canvas that is useful for rendering graphs, graphics, or other visual images and native support for scalable vector graphics (SVG) and math (MathML); and features supporting the development of and access to rich applications. (The HTML5 `<canvas>` element is used to draw graphics, on the fly, via scripting. The `<canvas>` element is a container for graphics, with the script, usually a JavaScript, which actually draws the graphics. A canvas is a rectangular area on an HTML page, with incorporated methods for drawing paths, boxes, circles, and text and adding images.)

HTML5 has been in use throughout its development. According to a 2014 survey, 42% of 10,000 developers polled are using the combination of HTML, CSS, and JavaScript for all or part of their mobile applications, and Gartner Research has identified HTML5 as one of the top 10 mobile technologies for 2015–2016, as “an essential technology for organizations delivering applications across multiple platforms.”^[49,50]

With the publication of the fifth version of HTML5 in late 2014, the W3C announced that HTML5 would serve as the core of the Open Web Platform, through which the W3C intends to lower the cost of developing cross-platform applications by focusing on the following issues:

- Security and privacy
- Web design and development
- Device interaction
- Media and real-time communications
- Performance and tuning
- Usability and accessibility
- Related services, including the social Web, payments, annotations, and Web of data^[51,52]

WHY HAS THE WEB BEEN SUCCESSFUL?

The Web has succeeded not only because many relevant conditions were “right” but also because it has relied from the outset on a simple, derivative architecture, consisting of the HTML, the HTTP, and the URL. A URL is a URI that also specifies the location of an identified resource and the protocol for retrieving it. In popular usage and in many technical documents, it is often confused as a synonym for uniform resource identifier.^[53] In the beginning, as Berners-Lee has noted, the World Wide Web represented a “basically trivial” expression of ideas, mainly about hypertext systems, that had been in circulation, in some instances for many years.^[54]

Moreover, since the advent of the graphical browser in 1995, the technologies of the World Wide Web have been easy for end users to manipulate, and that aspect coupled with the increasing rich blend of text, graphics, and links has created a huge global audience. Of equal importance is the fact that the Web's stewards, including Berners-Lee in his role as director of the W3C, have managed the continuing development of the underlying technologies in ways that have led to gradual changes and subtle transformations, rather than radical shifts. (Berners-Lee established the W3C in 1994 as a means of ensuring that Web-related standards would remain open. It was founded at the Massachusetts Institute of Technology Laboratory for Computer Science, with the support from the European Commission and the Defense Advanced Research Projects Agency, and quickly expanded its membership to include many other organizations, including most of the leading companies in the computer industry. By 2014, W3C membership had increased to 385 organizations.) For example, the path from the first version of the HTML to HTML 4.01 and XHTML and HTML5 is one marked by a commitment to interoperability and spirit of accommodation, whereby "[e]ach version of HTML has attempted to reflect greater consensus among industry players so that the investment made by content providers will not be wasted and that their documents will not become unreadable in a short period of time."^[55] At the same time, however, the interest in innovation that has driven the development of the Web has been manifested in other aspects of this stewardship, most notably in the development of the XML and proposal to develop what Berners-Lee and others refer to as the "Semantic Web."

In the longer term, the World Wide Web has succeeded because it is networked, but separate from the Internet. Berners-Lee has argued that this separation is of fundamental importance, because it allows the two layers of technology, the Internet and the Web, to work together while advancing independently.^[56] Moreover, the value of what the Web provides has grown in proportion to data, services, and users connected through it. Positive network externalities, the so-called network effect, have been reinforced by the extensibility of the Web's underlying technologies and the availability of an increasing large and diverse set of resources, often available to both content creators and users at little or no cost.

Of at least equal importance, the World Wide Web has succeeded and will endure because of a commitment to open technical standards that was made at the outset by Berners-Lee, and which he and others have sustained over the years, through the W3C, the Apache Foundation, and a host of other efforts. The commitment to open standards has thwarted efforts to exert private control over the Web and its technologies, and it has been a key factor in the Web's remarkable growth, allowing other innovators and entrepreneurs to leverage the Web's technologies in often creative ways. In the beginning, Berners-Lee opted for

technologies based on open standards, because his sponsor required interoperability and because he could afford no other choice. In so doing, he set in motion processes that have radically altered the course of the digital document's evolution.

The W3C endorses the Modern Paradigm for Standards, which is based on "[r]espectful cooperation between standards organizations, whereby each respects the autonomy, integrity, processes, and intellectual property rules of the others." Under the Modern Paradigm, standards are developed on the basis of five principles:

1. Due process, under which decisions are made with equity and fairness among participants, where no one party dominates or guides standards development, and standards-making processes are transparent and opportunities exist to appeal decisions, as well as review and update standards
2. Broad consensus, whereby processes allow for all views to be considered and addressed in order to facilitate agreement
3. Transparency, based on easily accessible records of decisions and the materials used in reaching those decisions and public comment periods provided before final standards approval and adoption
4. Balance, ensuring that standards activities are not exclusively dominated by any particular person, company, or interest group
5. Openness, providing relevant information to all participants and interested parties equally^[57]

IMPACT OF THE WORLD WIDE WEB ON LIBRARIES

The impact of the Web on libraries has been profound, changing the way libraries relate to vendors, clients, bibliographic utilities, and other libraries. What is more important is that the World Wide Web has liberated librarians and engendered new and often highly creative approaches to serving readers. The Web has had similar effects on publishers, ranging from scholarly presses to the U.S. Government Printing Office.^[58]

An example of how influential the Web has been may be found in the case of electronic journals. In the early 1990s, the publisher Elsevier ran The University Licensing Program (TULIP), an experimental project aimed at establishing an infrastructure for the distribution and delivery of e-journals.^[59] What is significant about TULIP in retrospect is that engineers at Elsevier assumed that the most effective and efficient means of delivering content would be to create a system under which digital subscriptions were maintained locally (meaning, in this instance, that copies of subscribed content would be maintained on servers situated with the subscriber's Internet domain) and updated regularly via the Internet. What they did not

envision was an Internet that would be fast enough to support the real-time distribution of journal articles or the emergence of a hypertext environment capable of linking databases to e-journals, journal articles to other journal articles via hyperlinked citations, articles to datasets, and so on. By the end of the 2000s, research libraries had reached a “tipping” point, whereby electronic journals, almost all of them delivered to libraries by means of the World Wide Web, outnumbered print subscriptions.^[60]

Integrated online library systems have been enhanced in a wide variety of ways, incorporating published and personal reviews of materials, support for bookmarking and personal account management, Web-based readers, citation formatting services, virtual reference services, etc. In recent years, access to library resources has been improved markedly, through the ongoing development of increasingly powerful discovery services and link resolvers. (The development of link resolution services is a great example of how the commitment to open standards has enhanced the functionality and efficacy of the Web as a medium for information interchange. Such services are based primarily on the OpenURL standard, which was developed by Herbert Van de Sompel and others in the late 1990s and early 2000s and then established as NISO standard in 2004.^[61])

Google Scholar is another interesting and important case in point where libraries and the Web are concerned. Google Scholar is designed to access to the scholarly literature through a single portal, supplying a means to find scholarly papers, abstracts, and citations, locate papers via libraries and/or websites, and learn about key works in “any area of research.”^[62,63] In many research library environments, it is also being used as a discovery system. (How effective is Google Scholar? It has been a matter of controversy, with some studies suggesting that Google Scholar’s coverage was substandard, but a recent study found that “as regards strict scientific impact, the analysis of GS data provides very similar results to the results obtained from traditional citation-based databases, with the advantage of being able to retrieve a larger and more varied number of citations, since they come from a wider range of document types, different geographical environments, and languages different to English.”^[64,65])

In addition, owing to the considerable efforts of archivists, curators, and scholars, there is a large and constantly expanding body of primary source materials available via the Web. Well-established projects like the American Memory Project at the Library of Congress continue to grow in terms of the number of collections available and the availability of collateral services.

The American Memory Project draws upon the collections of the Library of Congress and other institutions to provide “a digital record of American history and creativity.”^[66] In the process, materials to which access had previously been highly limited have become

available to the general public, in most instances accompanied by expert commentary. An early contribution to the American Memory Project concerning poet Walt Whitman and his notebooks is a good case in point. Conceived as a “test bed” for digital preservation and making collections available via the World Wide Web, digital facsimiles of four of Whitman’s notebooks, including a notebook that contains early drafts of segments of *The Leaves of Grass*, were rendered and made accessible via Web in a presentation entitled *Poet at Work: Recovered Notebooks* from the Thomas Biggs Harned Walt Whitman Collection.^[67] The significance of *Poet at Work: Recovered Notebooks* may be expressed on many levels, but it may be sufficient to say that in making available a body of material that has previously been available only to credentialed Whitman scholars, the American Memory Project changed forever the relationship between the Library of Congress and library users and that the World Wide Web served not only as the medium of presentation but also as an agent of change in a process that has brought the Library of Congress substantially closer to the goal of “serving the public as a resource for education and lifelong learning.”

Many newer projects are distinguished not only by their original content but also by their use of newer, interactive technologies; for example, the Georgia Virtual History Project is dedicated to recording the history of the state in digital forms and making those records available via the Web to “multiple audiences,” ranging from middle school students and the general public to college students and scholars.^[68] Another example is the eHistory website, as developed by the University of Georgia’s Center for Virtual History. eHistory was founded in 2011 by two historians in the belief that digital technologies afford new forms of research, in which students, scholars, and members of the public may act as collaborators. Like sites that call on “citizen scientists” and to gather and analyze data, eHistory projects involve “citizen historians” in amassing and analyzing historical data. The creators of eHistory that what has been labeled “citizen history,” often better reflects the way knowledge is created and consumed in the digital era.^[69]

The Web, or, to be more precise, the audience that the World Wide Web brings, has been the impetus for a series of scanning/content preservation projects, ranging from the controversial Google Books project to JSTOR to the Internet Archive. And the World Wide Web is also changing the form of the journal article, as publishers move from the PDF format to composite document formats based in significant part on HTML5. What Elsevier has dubbed the “article of the future” is a good example of widespread efforts to deploy “better ways to create and deliver the formal published record” by taking advantage of the expressive possibilities manifest in the continuing improvement markup and scripting languages.^[70]

GENERAL EFFECTS OF THE WORLD WIDE WEB

Technological Impact

The technological impact of the World Wide Web begins with the fact that Berners-Lee constructed a hypertext system based on open standards and capable of running in networked environments. It ends, for the time being, with the ongoing development of the Semantic Web and the emergence of compound documents within a multimodal “interaction domain.” It encompasses the development of an increasingly sophisticated system for structuring and formatting digital documents within an open technical framework and the creation of languages that define, respectively, concepts and relationships within domains of knowledge—the Web Ontology Language (OWL)—and establish a functional basis for statements, in the form of triples, for example, (Subject, Predicate, Object) or (Subject, Property, Value), linking data in order to describe both concepts and objects, the Resource Description Framework (RDF).^[71]

On another level, the World Wide Web has changed expectations in regard to computing and networking, to the point that with the rise of so-called cloud computing, the notion of the Web as a computing environment has taken on genuine meaning, in the form of myriad services, ranging from cloud storage services such as Google Drive to productivity software like Microsoft’s Office 365.

Social and Cultural Effects

The social and cultural effects of the World Wide Web are many, but perhaps the most pronounced have been observed in publishing, information retrieval, and collaborative work. Simply put, the Web has changed the meaning of the word “publish,” providing new and breathtakingly broad connotations and linking traditional forms of publication, such as book, newspapers, and journals, with blogs and wikis.

According to research conducted by the Pew Research Center, 14% of the adult population in the United States used the Internet. In 2014, 81% of U.S. adults use laptop and desktop computers somewhere in their lives, 87% of the adults in the United States use the Internet, and 73% use social media, a pattern of growth that Pew’s researchers attribute largely to the growth and popularity of the Web and the emergence of more interactive formats within the framework of the Web. In the so-called second generation of the Web, users have taken an increasingly active role. Almost all users are now able to “create new content, share it, link to it, search for it, tag it, and modify it”—Wikipedia, Facebook, Twitter, and YouTube being the most significant, and now classic, examples of this Copernican revolution.”^[72] The social impact of an enterprise as vast as the World Wide Web is difficult to gauge

in the fullest sense, but 90% of the Internet users polled by Pew believe that the Internet and the Web have been good for them personally, 76% regard the Internet and the Web as positive developments for society in general, and two-thirds of them indicated that “online communication has generally made them socially richer.”^[73,74]

In the realm of information retrieval, the Web has been a test bed that renewed and enlarged interest in information retrieval as a set of complex conceptual problems and procedural issues. At a practical level, the Web has facilitated the development of powerful tools, such as the Google Search Engine, it has placed those tools at the disposal of hundreds of millions of users, and it has created a competitive environment for IR services that virtually guarantees ongoing, vigorous commitments to basic research and development.

In terms of contemporary culture, the Web has altered how people inform themselves. News comes from the websites of CNN, *The New York Times*, the BBC, and tens of thousands of other outlets on the Web. Stock quotes, television program listings, restaurant menus, airline flight information, up-to-date weather information, satellite maps, and the current address of a distant relative or a long-lost friend are all types of information that hundreds of millions of people use the Web to locate and retrieve.

Even language has been altered. In the English-speaking world, “Google” has become a verb. A neologism arising from the popularity of the eponymous search engine, the American Dialect Society chose it as the “most useful word of 2002,” and it was officially added to the Oxford English Dictionary on June 15, 2006, and to the 11th edition of the Merriam-Webster Collegiate Dictionary in July 2006.^[75] (An interesting side note: Google has actively discouraged the use of the word as a verb, compelling some lexicographers to use a lowercase version of the word in order to avoid legal conflict with Google.)

The Web has also provided an operational as well as social environment consistent with the rapid development of systems for collaborative work, encompassing content management systems, collaborative authoring tools, learning management systems for asynchronous learning, Internet telephony, video conferencing, and resource sharing.

Scientists use the World Wide Web as an environment for providing remote access to and control of scientific instruments; they use the Web as the medium for grid-based architectures that combine entail parallel distributed computation, distributed data management and archiving, and interactive integrated visualization tools in support of their research.^[76]

Today, as “cyberinfrastructures” designed for research and development emerge, the focus of development in systems for computer-supported cooperative work is shifting to knowledge sharing within collaborative frameworks and building shared work environments that incorporate the ontological schema and services of the

Semantic Web. However, to date, the most significant collaborative project to be hosted by the Web is Wikipedia.

Wikipedia has created a remarkable amount of controversy, but it also stands as witness to the equally remarkable social forces that the Web has unleashed. It may not have been Jimmy Wales's aim to stand H.G. Wells notion of the "world brain" on its head, but Wikipedia and its many allied projects have demonstrated the reach of digital volunteerism and have shattered, perhaps forever, the myth that valuable knowledge resides mainly within universities.^[77] The Wikipedia model will undoubtedly undergo many modifications in the years ahead, some of them intended to bring collaborative models for building knowledge resources closer to the technocratic control that Wells envisioned, but no matter what happens in the future, the Wikipedia of the early twenty-first century will be remembered as revolutionary in nature and effect, because it has changed the way in which we think about encyclopedias and how they are made.

THE FUTURE OF THE WORLD WIDE WEB

When contemplating the future of the World Wide Web, it is necessary to consider what we actually know and understand about the system in its many dimensions and manifestations. Not long ago, it was argued that "[d]espite the Web's great success as a technology and the significant amount of computing infrastructure on which it is built, it remains, as an entity, surprisingly unstudied."^[78] That state of affairs has changed markedly in recent years, to the extent that many studies have been conducted and published, resulting in a plethora of data. However, what we know or understand about the Web, and particularly in reference to the Web as a social machine, remains limited and ultimately inadequate. In *Weaving the Web*, Berners-Lee "hypothesized that the architectural design of the Web would allow developers, and thus end users, to use computer technology to help provide the management function for social systems as they were realized online."^[79] In view of the fact that the success or failure of Web technologies often depends more on social factors than it does on technological issues, it may be argued that the ability to design and deploy successful applications requires a significantly better understanding of the features and functions of the social aspects of the systems.

At a technical level, the future of the World Wide Web is well defined, at least in the near term, by HTML5 and the Semantic Web. Each is an evolutionary extension of the World Wide Web.

The Semantic Web is an initiative and a broad area of work in which the semantics of information and services on the Web are defined in order to increase the precision of the results that are delivered to users in response to their queries.^[80] The core idea of the Semantic Web is to create

the metadata describing data, which will enable computers to process the meaning of things. Once computers are equipped with semantics, they will be capable of solving complex optimization problems.

The Semantic Web is based on Tim Berners-Lee's vision of the Web as a universal medium for data, information, and knowledge exchange and his belief that the existing Web may be so transformed through schemes based on the XML, focusing specifically on shifting the underlying structure of the Web from a vast file system into a huge, integrated database by marking up data and documents by content. From another perspective, the Semantic Web comprises a set of design principles, collaborative working groups, and a variety of enabling technologies. Some of the key elements of the Semantic Web are expressed as future possibilities that are yet to be implemented or realized. Other elements of the Semantic Web are expressed in formal specifications. These elements include RDF, a variety of data interchange formats (e.g., RDF/XML, N3, Turtle, N-Triples), and notations such as RDF Schema and the OWL, all of which are intended to provide a formal description of concepts, terms, and relationships within a given knowledge domain.

Is the Semantic Web inevitable? The answer is yes, insofar as it is the latest expression of humanity's desire to create better tools, because it is the logical next step in the development of information processing and distributed computing services, because its realization will play a major role in driving the global economy of the twenty-first century, and because it will also play a critical role in the development of the systems that are needed to ensure continuing progress in science, biomedical research, and other matters vital to humanity.^[81] When will the Semantic Web arrive? The key building blocks—RDF, OWL, etc.—are here already, but it will take some time, perhaps a long time, to annotate and capture the world's information in the appropriate ways.

One of the factors that may speed or delay the arrival of the Semantic Web is the speed with which intelligent applications, software implementing concepts from artificial intelligence that facilitate machine-to-machine communications, grow in operational sophistication. Realizing Berners-Lee's vision depends on an ability to generate and assimilate metadata on a scale and at a speed beyond collective human capabilities, and that process will depend, in turn, on the skill with which software agents (or "bots") are designed and deployed.^[82]

There are issues associated with HTML5, too. Owing to the rapid pace of device change and the attendant platform fragmentation—each browser and device vendor chooses what HTML5 features to implement—the deployment of HTML5 is uneven. Software tooling is regarded as inadequate, and many developers are not yet proficient in its uses.^[83] Even bigger problems stem from the differences in purpose that troubled the development of

HTML5. Web developers want HTML to become a better application platform, and, even though HTML5 has been approved by W3C, there is continuing concern among developers that the W3C, the organization that made a long and probably ill-advised commitment to XHTML, is neither flexible enough nor future-oriented enough to provide the necessary stewardship.^[84]

But the future of the World Wide Web will also be defined by a series of collateral developments and factors. Mobile computing is clearly one of the major factors. A rapidly growing array of smartphones and tablet computers already provides access to a large majority of the Internet's users in the United States, and because the devices themselves are growing more powerful and more sophisticated, this trend is not only expected to continue but to reshape more general patterns of computer (and Web) usage. Gaming systems will continue to play an important role in the future of the Web, as will online video, already a major force on the Web in the form of YouTube and Netflix. Software as a service will serve as a medium for more and more end-user computing, in many instances supplanting the personal computer, and evolutionary changes in the design of operating systems and applications will produce growing amounts of structured information, thus paving the way for more intelligent computing.

In education, the Semantic Web's greatest impact will be in the ways in which data integration influences how knowledge is aggregated, organized, and presented to students. As noted in a related essay

One vision of a well-developed semantic web includes a search feature that would return a multimedia report rather than a list of hits. The report would draw from many sources, including websites, articles from scientific repositories, chapters in textbooks, blog dialogue, speeches posted on YouTube, information stored on cell phones, gaming scenarios played out in virtual realities—anything appropriate that is accessible by the rules of Web 3.0. The report would consist of short sections that coalesce around knowledge areas that emerged naturally from your research, with keywords identified and listed conveniently off to one side as links.

The information in the report would be compared, contrasted, and collated in a basic way, presenting points of agreement and disagreement, and perhaps associating these with political positions or contrasting research. Because the web knows something about you, it also alerts you to local lectures on related topics, books you might want to read, TV programs available through your cable service, blog discussions you might find relevant, and even local groups you can contact that are also focused on this issue. Unlike a standard report, what you receive changes as the available information changes, and you might have wiki-like access to add to or edit it. And because you told your agent that this topic is a high priority, your cell phone will beep when a significant

development occurs. After all, the semantic web will be highly inclusive, providing a common language for many kinds of media and technologies, including cell phones. The net result, ideally, is that you spend less time searching and sifting and more time absorbing, thinking, and participating.^[85]

Education will also be affected, perhaps profoundly, by the rise of “just-in-time” learning. Unlike traditional educational models, which are essentially supplier-driven systems that work efficiently for instructors, “just-in-time” learning is predicated on consumer-driven systems that are designed to work effectively for students, making learners active participants in the educational process. The new model focuses on learning rather than on teaching. More to the point, “just-in-time” models achieve their goals by moving from standardized to customized content, from discrete time and place to anytime and anyplace delivery, and from passive lecture models to interactive and applied learning, all of which can and will be supported by the technologies of the Semantic Web.

For libraries and archives, the changes are likely to be many and great, encompassing many, if not all of the trends noted earlier. The decline of the importance of the library as a place is inevitable. Competition for the attention and loyalties of digital information consumers will grow only keener, and librarians who wish to survive and flourish will necessarily adopt new approaches to serving clients. However, perhaps the most profound change before librarians and archivists may well be changes in the form of documents, as new technologies and the continuing pressure to improve formal communications in science, technology, and medicine combine to alter both the form and content of the scholarly (or professional) paper. The result will be the compound digital document, basically a framework for integrating text, multimedia, datasets, and hyperlinks, and those documents will present new, serious challenges across the spectrum of bibliothecal functions. (Librarians are certain to face major challenges in the area of client privacy. As the personalization of Web-based services increases, libraries will be challenged by consumer expectations and forced to confront the inevitable conflicts between the demand for more personalized services and the traditional guarantees of privacy that libraries and librarians in many countries have maintained zealously.)

Finally, the dominant role of the United States in the use and development of the World Wide Web will be somewhat diminished, as continuing growth in China, India, and parts of Africa changes the demographics of the Web's user population and broadens the base of developers and providers. Internet governance issues have become more important and more difficult. A new and potentially more balanced order for Internet governance is emerging, but there are myriad challenges to that new order, the most significant of them being government

censorship and surveillance. In the midst of these changes, the stability of the Web will depend, as it has for the last 20 years, on the W3C, the commitments that Tim Berners-Lee has fostered with such great success, and the ability of its leadership, in the midst of change and contentiousness, to maintain a unifying sense of purpose.

World Wide Web Consortium (W3C)

Terrence Brooks

iSchool, University of Washington, Seattle, Washington, U.S.A.

Abstract

The World Wide Web Consortium (W3C) is the organization that leads the development of standards for the Web. Sir Tim Berners-Lee, the founder and current director of the W3C, envisions a linked network of information resources that guides Web standards development and points the way towards the creation of a Semantic Web. This entry describes the pioneering role of Berners-Lee in the development of the Web, the accomplishments and vision of the W3C, and the development of the Semantic Web.

INTRODUCTION

This entry introduces the World Wide Web Consortium (W3C) by outlining the pioneering role of Sir Tim Berners-Lee in the creation of the Web and Web browsers, the development process employed by the W3C community to construct Web standards, and the vision and development of the Semantic Web.

In 2007 the W3C was an international consortium with more than 400 members. Berners-Lee leads a team of about 60 researchers and engineers who are located primarily in three institutions: the Massachusetts Institute of Technology Computer Science and Artificial Intelligence Laboratory (MIT/CSAIL); the European Research Consortium in Informatics and Mathematics, Nice, France (ERCIM); and Keio University in Japan.

The W3C is the leading organization in the development of Web standards and general guidelines for Web development. Its general mission is the development of Web standards and protocols that maximize benefits for the greatest number of people. While the process model of the W3C is consensual agreement and cooperation, it lacks any means to coerce the adoption of its standards and protocols.

Since 1994, the W3C has published more than 90 Web standards called W3C Recommendations. By building applications that comply with W3C recommendations, a Web developer supports the community of users and software that promote the sharing of information and platform independence. Berners-Lee and the W3C can justifiably be credited with inventing the World Wide Web, pioneering the development of the Web browser, and developing the protocols that make sharing information possible.

THE VISION OF THE W3C

The ultimate motivation of the W3C springs from the vision of Berners-Lee for the Web, and has been

variously expressed as the W3C motto: “To lead the World Wide Web to its full potential by developing protocols and guidelines that ensure long-term growth for the Web,” or more simply “Leading the Web to its full potential...” This vision privileges the notions of interoperability and device independency, and suggests a public network where information can be easily shared among strangers, and is not confined to a specific application software suite or a particular vendor’s products. The essence of the W3C vision is that a document or program that follows W3C specifications should work identically across different applications and different computers. To “work identically” in this context means that the essential information or functionality is preserved, while conceding that presentation issues such as the size of the display device, color options, accessibility accommodations, and so on, may introduce variability.

The vision of the W3C is displayed by its future of the Web document^[1] which claims that the Web is for:

- *Everyone* (regardless of culture, abilities, etc.).
- *Everything* (applications and data stores, and on devices ranging from power computers with high-definition displays to mobile devices to appliances).
- *Everywhere* (from high to low bandwidth environments).
- *Diverse mode of interaction* (touch, pen, mouse, voice, assistive technologies, computer to computer).
- *Enable computers to do more useful work* (through advanced data searching and sharing).

To complement its advocacy of interoperability and device independence, the W3C also promotes accessibility. Accessibility refers to the degree that application software is sympathetic to people with disabilities, but also in a more general sense, the degree to which applications can be used in environments degraded by noise, lighting, etc.

THE SEMANTIC WEB

Residing behind the W3C's vision of the Web as networked personal and corporate information is the more ambitious vision of the Web as a network of semantics. An early statement of this particular vision of the Semantic Web appeared in the *Scientific American*.^[2] This entry sketched a Web network of publicly available documents that possessed semantics structured as metadata. These metadata were to be harvested mechanically and manipulated by inference tools to solve ad hoc everyday problems such as finding the office hours of the closest doctor, the cheapest available tickets for the theater, and so on. The subtitle of the *Scientific American* article summarizes this vision of a Semantic Web: "A new form of web content that is meaningful to computers will unleash a revolution of new possibilities."

This original description of the Semantic Web was refined^[3] by suggesting the difference between the Web of public HTML documents destined to be displayed in Web browsers, and a web of structured data that would be amenable to mechanical harvest. Theoretically, these two Webs would coexist and even overlap as HTML documents destined for display in Web browsers might also contain structured metadata. An example technology that could be used in this way would be Resource Description Framework attributes (RDFa). Examples of the data that exist on the Web and that could be harvested mechanically might be calendar data, travel arrangements, photograph descriptions, and financial transactions.

The vision of the Semantic Web as a web of linked open data has come to dominate. The result might be called a web of data, where islands of semantics exist; that is, pools of structured documents on the open Web that could be harvested mechanically. Current efforts are now focusing on linking common data points that are related but exist in different semantic islands on the Web. In summarizing the achievements and challenges of constructing the Semantic Web, Ivan Herman^[4] gives a voice to the shift of the Semantic Web from a single huge, central ontology organizing all knowledge, which would be unmanageable if not impossible to construct. Instead he described the use of numerous ontologies and vocabularies, such as Friend of a Friend (FOAF) and Dublin Core (DC) that would capture local richness and encourage the discovery of new relationships among data. The challenge of such architecture is linking disparate data points together.

The Linking Open Data project^[5] centralizes the increasingly common construction of resources that are available for the mechanical harvest of structured information. The following enumerates some of the structured data available on the Web, which are, in effect, islands of semantics that might be linked together:

- IgentaConnect (<http://www.ingentaconnect.com/>) offers bibliographic metadata storage and has more than 200 million RDF triplets available.
- RDFS/OWL Representation of WordNet (<http://wordnet.princeton.edu/>) has 150MD of RDF/XML available for download. WordNet facilitates the browsing of meaningfully related words and concepts.
- "Département/canton/commune" is available from the French Statistical Institute and represents statistical surveys on population, employment, wages, prices, business, economy, and French national accounts.
- Geonames Ontology and Data has information on 6 million geographical features.
- RDF Book Mashup makes information about books, their authors, reviews, and online bookstores available on the Semantic Web. Information drawn from sources such as Amazon, Google, and Yahoo can be integrated into the Semantic Web.
- dbpedia is a community effort to extract structured information from Wikipedia and link this information to other sources of structured information.

Semantic Web Case Studies and Use Cases^[6] list descriptions of systems that have been deployed in industry that use Semantic Web techniques.

HISTORICAL HIGHLIGHTS OF THE W3C

The invention of the World Wide Web in 1989 was a by-product of Berners-Lee's solution to a document sharing problem at CERN (European Organization for Nuclear Research). He proposed a global hypertext project of linked documents to help people coordinate their work during large project development. To manifest his vision he created the first World Wide Web server and the first browser/client called "World Wide Web." This early Web browser was first offered to CERN in December 1990 and then to the Internet at large in the summer of 1991.

During the period of 1991 to 1993, Berners-Lee extended the development of the Web by constructing basic technologies such as Uniform Resource Identifiers (URIs), Hypertext Transfer Protocol (HTTP), and Hypertext Markup Language (HTML). As an early model of community development, Berners-Lee's technological initiatives were modified by feedback from the nascent Web community. In 1994 Berners-Lee founded the W3C at MIT/CSAIL where he is a senior research scientist.

The beginnings of the World Wide Web can be found in the proposal "Information Management: A Proposal"^[7] placed by Berners-Lee before CERN's governing board. Its ambition was to solve the information management problems of large projects by utilizing the idea of a hypertext, which had been pioneered by Nelson.^[8] Such a hypertext featured human-readable information linked together in ad hoc and unconstrained ways, thus

promoting the discovery of hitherto unrecognized parallels or points of convergence among disparate texts.

In September 1992 Berners-Lee gave an invited presentation to the Computing in High Energy Physics 92 conference, where he claimed that the “W3 project merges networked information retrieval and hypertext to make an easy but powerful global information system...W3 now defines the state of the art in networked information retrieval, for user support, resource discovery and collaborative work.” In 1993 the CERN W3 software suite appeared in the public domain.

The first W3C recommendation, for Portable network graphics (PNG), appeared in October 1996. Within several years, major recommendations were issued that were foundational for the growth and development of the Web. These included the recommendation for HTML 4.0 in December 1997, which added tables, scripting, and style sheets. These features permitted authors to create significantly more expressive Web content. And in February 1998, the recommendation for XML 1.0 appeared. XML provided a platform for a host of following recommendations and has evolved into a universal language of the Internet.

The following enumerates some of the important historical achievements of the W3C:

- The portable network graphics recommendation in October 1996 provides a cross-platform graphics format.
- The Cascading style sheets recommendation of December 1996 laid the foundation for a uniform strategy for adding style (e.g., fonts, colors, spacing) to Web pages.
- The Web accessibility initiative of February 1997 promoted accessibility of the Web through four primary areas of work: technology, tools, education and outreach, and research and development.
- The HTML 4.0 recommendation of December 1997 added new features to Web publishing such as tables, scripting, style sheets, internationalization, and accessibility.
- The XML 1.0 recommendation of February 1998 introduced the fundamental technology that would become an influential Web standard.
- In August 2000, the scalable vector graphics recommendation introduced two-dimensional graphics and graphical applications in XML.
- XML schema recommendation of May 2001 provided a standard method of architecting XML vocabularies.
- Web services activities introduce a fundamental protocol for Web services in January 2002.
- In May 2003 the W3C adopted a royalty-free patent policy and encouraged the development of open standards.
- Two fundamental protocols of the Semantic Web, RDF and Web ontology language (OWL) were introduced in February 2004.

- In March 2004, VoiceXML promoted the use of interactive voice response applications to Web-based development and content delivery.
- The W3C mission of universal access was promoted in February 2005 with the introduction of the character model recommendation. The goal of the character model recommendation was the ease of use of the Web regardless of language, script, writing system, and cultural conventions.
- The mobile Web initiative of May 2005 set the mission of making Web access from a mobile device as simple as Web access from a desktop device.
- In November 2005, the Semantic Web for health care and life sciences interest group (HCLSIG) deployed standardized Semantic Web specifications for the medical industry.

This historical listing illustrates the foundational role of the W3C in designing specifications and protocols that foster the sharing of information. The culmination of the worldwide sharing of information is expressed in the vision of the Semantic Web.

MEMBERSHIP OF THE W3C

The W3C brings together a diverse group of stake holders to achieve its mission of developing Web standards and protocols. As of 2008 there were more than 400 members of the W3C representing more than 40 countries. Approximately 37% of these members are American and about 9% are from the United Kingdom. The stake holders of the W3C represent many different types of organizations with the largest category being consultants and systems integrators followed by the university research and development category and the general software companies category. Other categories of members include vendors of technology products and services, content providers, corporate users, research laboratories, standards bodies, and governments.

ACTIVITIES OF THE W3C

The activities of the W3C manifest themselves as various kinds of groups. Working groups focus on technical developments, interest groups focus on nontechnical issues, and coordination groups focus on the communication among related groups.

The following is an overview of some of the leading activities of the W3C:

- XML activities represent a core set of technologies around which orbit a number of working groups that are focused on development in the areas of extensible

stylesheet language (XSL), efficient XML interchange, XML binary characterization, XML processing model, and XML linking, query, and schema.

- Graphics activities focus on the development of scalable vector graphics (SVG) technologies.
- The HTML activities group works on the evolution of this standard language of the Web. The current goal is to evolve HTML into an XML-based markup language and thereby ease its use with other markup languages.
- Internationalization activities work to ensure that the W3C's formats and protocols are amenable to all of the world's languages, writing systems, character codes, and local conventions.
- Math activities facilitate the use and presentation of mathematics on the Web.
- Mobile Web activities are working to overcome fundamental interoperability and usability problems associated with mobile Web access. They attempt to integrate the key players in the mobile area: authoring tool vendors, content providers, handset manufacturers, browser vendors, and mobile operators.
- Multimodal interaction activities target the ability of Web users to dynamically switch to the most appropriate mode of interaction. Ideally, a multimodal Web application would permit users to input data via speech, handwriting, and keystrokes, and receive output via displays, prerecorded and synthetic speech, audio, and various haptic displays.
- Patent policy activities alert the W3C community about developments in the legal and standards environment.
- Rich Web client activities focus on Web-based applications that extend the user experience on the Web beyond static HTML. Often these applications support compound documents that combine multiple formats such as Extensible Hypertext Mark-up Language (XHTML), SVG, Synchronized Media Integration Language (SMIL), and XForms.
- Security group activities focus on the security context of Web applications that prevent surfers on the Web from being deceived and defrauded.
- Semantic Web activities focus on the creation of a universal medium for the exchange of data. Ideally both personal information and enterprise applications would be smoothly integrated creating a global sharing of commercial, scientific, and cultural data.
- Style activities focus on style components of Web pages. This group is working to extend style to other types of documents such as XML, SVG, and SMIL.
- Synchronized multimedia activities focus on choreographing multimedia presentations where audio, video, text, and graphics are combined in real time. A Timed Text working group is working is designing formats for streaming text synchronized with other timed media.
- Ubiquitous Web applications activities focus on enabling value-added services and business models for ubiquitous networked devices.
- Voice browser activities aim at technologies for capturing and producing speech and managing the dialog between user and computer.
- Web content accessibility initiative (WAI) focuses on accessibility to the Web resources, while the WAI technical group focuses on the technical aspects in three areas: Web content, user agent, and authoring tool accessibility.
- Web services activities promote the technology of Web services as a standard means of interoperability between different software applications running on a variety of platforms and frameworks. This group is designing the infrastructure, architecture, and core technologies for Web services.
- XForms activity focuses on the use of Web forms for the collection and distribution of information.

New areas of interest and activity are incorporated into the W3C by a recommendation development process.

RECOMMENDATION DEVELOPMENT PROCESS

The W3C strives to create high-quality standards for the Web through the strategy of community consensus. The general public is encouraged to join the members of the W3C in coming to consensus of Web standards and protocols. A new development begins with expressions of interest in a topic, and perhaps a workshop that brings interested persons together for the exchange ideas and information. Next, a proposal for a new activity describes the scope and duration of the project, as well as working groups, interest groups, and coordination groups that will carry out the work. As the development work proceeds, candidate specifications and guidelines cycle in revision and review as they advance to recommendation status. This may be a long process that may ultimately lead to a success recommendation, or may result in the abandonment of the proposal. As successful proposals near completion, a W3C advisory committee finally examines the mature proposal and issues a recommendation.

CONCLUSION

The W3C has had a major influence on the creation of the World Wide Web, arguably the most important public information utility of our age. It has taken as its mission the development of the Web in the manner of consensus building with the aim of creating the greatest benefit for the greatest number. As the Web grows in size and sophistication, more and more Semantic Web applications are appearing.

XML Information Retrieval

Mounia Lalmas

Department of Computing Science, University of Glasgow, Glasgow, U.K.

Abstract

Nowadays, increasingly, documents are marked-up using eXtensible Mark-up Language (XML), the format standard for structured documents. In contrast to HTML, which is mainly layout-oriented, XML follows the fundamental concept of separating the logical structure of a document from its layout. This document logical structure can be exploited to allow a focused access to documents, where the aim is to return the most relevant fragments within documents as answers to queries, instead of whole documents. This entry describes approaches developed to query, represent, and rank XML fragments.

INTRODUCTION

Documents can be structured or unstructured. Unstructured documents have no (or very little) fixed predefined format, whereas structured documents are usually organized according to a fixed predefined structure. An example of a structured document is a book organized into chapters, each with sections made of paragraphs and so on. Nowadays, the most common way to format structured content is with the W3C standard (<http://www.w3.org/XML/>) for information repositories and exchanges, the eXtensible Mark-up Language (XML).

Much of the content available on the Web is formatted in HTML. Although HTML imposes some structure on a Web content, this structure is mainly for presentation purposes and carries little meaning. In contrast, XML is used to provide meaning about the stored content. More precisely, in the context of text documents, with which this entry is concerned, XML is used to specify the logical, or tree, structure of documents, in which separate document parts (e.g., chapter, section, abstract) and their logical structure (e.g., a chapter made of sections, a section and its title, an article and its abstract) are explicitly marked-up. As an increasing number of documents are being made available in XML format, effective means to access them are needed. As for standard (unstructured) documents, this requires appropriate query languages, representation methods, and ranking algorithms.

Approaches for accessing logically structured documents were first proposed in the 1990s.^[1–4] In the late 1990s, as XML was adopted as the standard document format, approaches for what became known as XML information retrieval were being developed.^[5–7] Research in XML information retrieval was then further boosted with the set-up in 2002 of the Initiative for the Evaluation of XML Retrieval (INEX),^[8] a yearly evaluation campaign that provides a forum for the evaluation of approaches specifically developed for XML information

retrieval. INEX provides test collections and evaluation measures, which make it possible for organizations worldwide to evaluate and compare their XML information retrieval approaches.

By exploiting the logical structure of XML documents, the goal of an XML information retrieval system is to implement so-called focused retrieval strategies, which aim at returning document components, i.e., XML elements, instead of whole documents in response to a user query. These focused retrieval strategies aim to break away from the traditional retrieval unit of a document as a single large (text) block. This is believed to be of particular benefit for information repositories containing long documents, or documents covering a wide variety of topics (e.g., books, user manuals, legal documents), where the users effort to locate relevant content within a document can be reduced by directing them to the most useful parts, i.e., the most useful XML elements, in the document.

To identify the most useful XML elements to return as answers to given queries, XML information retrieval systems require:

- Query languages that allow users to specify the nature of relevant components, in particular with respect to their structure.
- Representation strategies providing a description not only of the content of XML documents, but also their structure.
- Ranking strategies that determine the most relevant elements and rank these appropriately for a given query.

In this entry, we provide an overview of “Query Languages,” “Representation Strategies,” and “Ranking Strategies” developed for XML information retrieval. The representation and ranking strategies presented in this entry were evaluated within the INEX evaluation campaigns.^[9–14]

The entry finishes with some conclusions on XML information retrieval research, and some references to early work related to XML information retrieval.

QUERY LANGUAGES

XML documents are organized into a logical structure, as provided by the XML mark-up. For example, a scientific article, such as those forming the INEX test collection used in INEX (see Fig. 1), consists of a front matter (<fm>), a body (<bdy>), and a back matter (<bm>). The front matter contains the article's metadata, such as title, author, publication information, and abstract. Following it is the article's body, which contains the actual content of the articles, and is structured into sections (<sec>), subsections (<ss1>), and sub-sub-sections (<ss2>). These logical units start with a title, followed by a number of paragraphs. The back matter contains a bibliography and further information about the article's authors.

Users may want to specify conditions to limit the search to specific XML elements. For example, a user may want sections discussing "XML retrieval evaluation," whereas another user may look for paragraphs about

"effectiveness measures" contained in sections about "XML retrieval evaluation." Here we have a combination of content constraints, "XML retrieval evaluation" and "effectiveness measures," typical to information retrieval, and structural constraints, "section," "paragraph," and "paragraph within section." XML query languages have been developed with the aim to express various levels of content and structural constraints. They can be classified as content-only or content-and-structure query languages.

Content-only queries make use of content constraints only, i.e., they are made of words, which is the standard form of input in information retrieval. They are suitable for XML retrieval scenarios where users do not know, or are not concerned, with the document logical structure when expressing their information needs. Although only content conditions are being specified, XML information retrieval systems must still determine what are the best fragments, i.e., the XML elements at the most appropriate level of granularity, to return to satisfy these conditions. For example, the best answer for a query "XML retrieval evaluation" may be a subsection and not a section, as the section, although relevant, may be less specific to the query than the subsection. An XML information retrieval system task is to determine this appropriate level of granularity for any given query.

Content-and-structure query languages provide a means for users to specify content and structural information needs. It is toward the development of this type of queries that most research on XML query languages lies. We can distinguish between three main categories of content-and-structure XML query languages, namely in sections "Tag-Based Languages," "Path-Based Languages," and "Clause-Based Languages." For the latter two types, we provide a brief description, mainly through examples, of current languages, namely XPath and Narrowed Extended XPath I (NEXI), and XQuery and XQuery Full-Text, respectively.

Tag-Based Queries

With tag-based queries, words in the query are annotated with a single tag name, which specifies the type of desired result elements, e.g., a section, an abstract. For example, the information need "retrieve sections about XML retrieval evaluation" would be expressed as `section: XML retrieval evaluation`. An example of a tag-based query language is XSearch.^[15]

Tag-based queries are intuitive, and have been used in domains outside XML information retrieval (e.g., faceted search, Web search). However they only express simple, although important and likely common, structural constraints. They cannot express, for instance, relationship (structural) constraints, e.g., "a paragraph contained in a section," which may be needed for complex retrieval scenarios.

Path-Based Queries

Path-based queries are based upon the syntax of XPath (XML Path language, <http://www.w3.org/TR/xpath>), which has been defined by the W3C to navigate to components of an XML document. The most important concept in XPath is the location path, which consists of a series of navigation steps characterizing movements within an XML document.

For example, `chapter/section` is a location path, where `chapter` and `section` are steps that navigate to elements of types “chapter” and “section,” respectively. The fact that the steps are separated by “/” means that the location path selects section elements directly below chapter elements. Section elements are referred to as children of chapter elements. The navigation steps can be separated by “//”. For example, `chapter//section` navigates to all section elements that are directly or indirectly below a chapter element. Section elements are referred to as descendants of chapter elements. Special steps include the self step denoted “.” and parent step “..”. For example, `./section` returns all section elements contained directly or indirectly in the currently navigated element.

At each step, predicates can be specified between “[” and “]”, which must be satisfied for elements to be navigated into. For example, the following XPath query `//article[@year=2002]/title` selects the “titles” of “articles” published in 2002, and only those.

An important function in XPath for the purpose of XML information retrieval is the function `contains()`. For example, the query `//section [fn : contains (. /title, “XML retrieval”)]` will return all section elements with a title containing the string “XML retrieval”. The result of this XPath query is a set of section elements, and not a ranked list of section elements. Thus XPath is not an XML query language that can be directly used in XML information retrieval. Nonetheless, it is used by, or has inspired, other path-based query languages, some of which allowing the ranking of results, e.g., XXL,^[16] XIRQL,^[17] and NEXI.^[18] We discuss the last one, NEXI.

The NEXI query language was developed by INEX, as a simple query language for XML information retrieval evaluation. NEXI consists of a small but enhanced subset of XPath. The enhancement comes from the introduction of a new function, named `about()`, which requires an element to be about some specified content criteria. It replaces the XPath `contains()` function, to reflect that an element can be relevant to a given query without actually containing any of the words used in the query.

A small subset of XPath was chosen because NEXI was not developed to test the expressiveness of a query language for XML information retrieval, but to evaluate XML information retrieval effectiveness. For instance, the parent/child navigation step “/” was considered

particularly problematic as it was open to misinterpretation by assessors, and hence was dropped. We recall that in information retrieval evaluation, assessors are used in the process of building a test collection. Their task is to judge the relevance of the information returned to them as answers to given queries. All result elements must have at least one `about()` function. This is because for the purpose of evaluating retrieval effectiveness, what matters is that the relevant elements are actually returned. For instance, the following query `//section [about(., XML retrieval)]/title`, which requests titles of sections about “XML retrieval evaluation,” is not allowed in NEXI; it is indeed a mechanical process to return the title of a section deemed relevant to “XML retrieval.”

We finish with an example of a NEXI query:

```
//article [about(. //bdy, XML retrieval)]//
section [about(., evaluation)]
```

This query is asking for section elements about “evaluation” contained in articles that have a body that discusses “XML retrieval.”

NEXI was developed by INEX for the purpose of evaluating XML information retrieval effectiveness. It remains the task of the XML information retrieval system to interpret a NEXI query, where the interpretation is with respect to the `about()` condition as implemented by the retrieval model, and the structural constraint as implemented by the query processing engine, used by the XML information retrieval system. Sections “Scoring Strategies” and “Combination Strategies” describe approaches used to implement the `about` conditions, whereas section “Processing Structural Constraints” describes approaches used to process structural constraints, for the purpose of ranking XML elements for given queries.

Clause-Based Queries

Clause-based queries for XML information retrieval can be compared to SQL, the standard query language for (relational) databases. These queries are made of nested clauses to express information needs. The most prominent clause-based query languages for XML information retrieval are XQuery (<http://www.w3.org/TR/xquery/>) and XQuery Full-Text (<http://www.w3.org/TR/xpath-full-text-10/>).

XQuery is an XML query language that includes XPath as a sublanguage, but adds the possibility to query multiple documents and combine the results into new XML fragments. The core expressions of XQuery are the FLWOR expressions, which we illustrate with an example. The following query is a FLWOR expression that lists the authors, ordered by their last name, that have written at least 100 articles:

```

for $aut in (doc ("aut.xml")//author)
  let $c:=
    count (doc("article.xml")/article
      [author=$aut])
    where $c>100
    order by $aut/lastname
  return
  <author>{$aut/lastname,$c}</author>

```

The `for` (F in FLWOR) clause binds the variable `$aut` so that it iterates over the author elements in the document “aut.xml” in the order that they appear. For every such binding, the `let` (L) clause binds the variable `$c` to the number of articles from author `$aut` (from the document “article.xml”). Those author elements for which the condition in the `where` (W) clause is true are selected, i. e., number of articles is above 100. The resulting bindings are sorted by the `order by` (O) clause on the author last name. Finally, the `return` (R) clause creates for each binding `$aut` and `$c` in the result of the preceding clause a new author element that contains the last name element of the author, and the associated number of articles.

XQuery is a powerful XML query language. However, its text search capabilities are limited and, in addition, the result is a set of (new) XML fragments; no ranking is performed. Thus its usefulness in XML information retrieval is limited. This has led to the development of XQuery Full-Text.^[19]

XQuery Full-Text has been inspired by earlier query languages for searching structured text, e.g., ELIXIR,^[20] JuruXML,^[21] XIRQL.^[17] The added text search capabilities come with the introduction of the *FTContainsExpr* expression, as shown in the following example:

```

//article[./title ftcontains {"XML",
  "retrieval"}
all] // author

```

which returns the authors of articles whose title contains the words “XML” and “retrieval.” XQuery Full-Text defines primitives for searching text, such as phrase, word order, word proximity, etc. For example, the following XQuery Full-Text expression:

```

//article[./title ftcontains {"XML",
  "retrieval"}
all window 6 words]//author

```

restricts the proximity of the matched words to appear within a window of six words in title elements.

To support the ranking of results, *FTScoreClause* expressions have been introduced to allow for the specification of score variables. For instance, the following query:

```

for $b score $s in //article [./section
  ftcontains

```

```

{"XML", "retrieval"} all]
  order by $s descending
  return <article title= "{$arti-
    cle/title}"
    score= "{$s}"/>

```

iterates over all articles whose sections contain both “XML” and “retrieval”, where the `$b` variable binds the score of each such article to the score variable `$s`. These variables are used to return the titles of the articles and their scores in order of decreasing relevance.

XQuery Full-Text does not implement a specific scoring method, but it allows an implementation to proceed as it wishes. In other words, each XQuery Full-Text implementation can use a scoring method of its choice. Therefore, an appropriate implementation of XQuery Full-Text can allow ranking of results. From a user perspective, XQuery Full-Text may be viewed as far too complex, which is one of the reasons the INEX community developed NEXI, a path-based query language with less expressiveness than a clause-based query language, as its query language. A second one was to keep the construction of the test collections manageable, for instance during the assessment task (see explanation on “assessors” earlier in the entry). Nevertheless, XQuery Full-Text is needed in applications involving expert users, e.g., medical domain, patent industry, law.

REPRESENTATION STRATEGIES

To retrieve documents relevant to a query, the first task of an information retrieval system is to index all documents forming the searched collection. The indexing task aims to obtain a representation of the content of documents (i.e., what each document is about), which can then be used to score each document according to how relevant it is to a given query. Classical indexing strategies in information retrieval make use of term statistics, the most common ones being the within-document term frequency, *tf*, and the inverse document frequency, *idf*. *tf* is the number of occurrences of a term in a document and reflects how well a term captures the topic of a document; a term that occurs frequently in a document can be considered a good description of the document content (apart from common words, referred to as stop words, e.g., “the,” “every” in the English language). *idf* is the inverse number of documents in which a term appears and is used to reflect how well a term discriminates between relevant and non-relevant documents; a term that appears in all documents of the collection is not good at discriminating between the content of two documents, and hence their relevance or nonrelevance.

With these term statistics, an index is build, for instance in the form of an inverted file, which gives for

each term in the collection its *idf*, and for each document containing that term, the corresponding *tf*. Indexing algorithms for XML information retrieval require similar terms statistics, but at element level, i.e., they require so-called within-element term frequency, *etf*, and inverse element frequency, *ief*. The indexing of a collection of documents involves other steps than calculating term statistics. These include tokenization, stop word removal, stemming, etc.^[22] In XML information retrieval, the same steps are applied, and other steps such as parsing the XML format, which are not discussed in this entry. Also not discussed in this entry is that an index of the structure is build in order to record the relationships between elements.

In XML information retrieval, there are no a priori fixed retrieval units. The whole document, a part of it (e.g., one of its sections), or a part of a part (e.g., a paragraph in the section), that is, elements at all levels of granularity, all constitute potential answers to a given query. The simplest approach to allow the retrieval of elements at any level of granularity is to index all elements. Each element thus corresponds to a document, and conventional information retrieval representation techniques can be used. Term statistics (*etf* and *ief*) for each element are then calculated exactly in the same way as for *tf* and *idf* but based on the concatenation of the text of the element and that of its descendants.^[23]

This is the most common approach. It however raises an issue because of the nested nature of the units forming an XML document: the *ief* value of a term will consider both the element that contains that term and all elements that do so in virtue of being ancestors of that element. For instance, for a section element composed of two paragraph elements, the fact that a term appears in the paragraph implies that it also appears in the section. This “double” occurrence may have an adverse effect with respect to using *ief* to discriminate between relevant and nonrelevant elements.

As a consequence, alternative means have been used to calculate *ief*. For instance, *ief* has been estimated across elements of the same type^[24] or across documents.^[25] The former greatly reduces the impact of nested elements on the *ief* value of a term, but does not eliminate it if elements of the same type are nested within each other (as it is the case with the Wikipedia test collection used at INEX^[26]). The latter is the same as using inverse document frequency, which completely eliminates nested elements. Experimental results^[27] indicate that estimating *ief* across documents shows slight improvement over using elements. However, other experimental results^[28] show that better performance was obtained estimating *ief* across all elements than across elements of the same types. As of today, it is not yet clear what is the best way to estimate *ief*, whether the estimation strategy depends on the retrieval model and its artifacts used to rank elements, or whether the issue of nested elements actually matters. Further research is needed here.

An alternative to using the concatenated text in an element to estimate term statistics is to derive them through the aggregation of term statistics (both *etf* and *ief*) of the element’s own text, and those of each of its children elements.^[29,30] Aggregated-based ranking, discussed in section “Aggregation,” uses the aggregated representation of elements to rank elements.

A second alternative approach is to only index leaf elements. A leaf element is one at the bottom of the document tree structure, i.e., an element with no children elements, or an element that is considered the smallest possible unit of retrieval. This implies that term statistics will only be calculated for leaf elements, which can then be used to rank the leaf elements themselves. With such strategy, the ranking of non-leaf elements requires propagation mechanisms (discussed in section “Propagation”) that combine the score of their children elements into that of the element.^[31] Both this and the above (aggregation) strategies overcome the issue of nested elements with respect to the calculation of *ief*.

It has also been common to discard elements smaller than a given threshold (usually expressed in terms of number of words),^[23] which are often considered not meaningful retrieval units (they are too small to make much sense as results). It was however argued^[32] that although the small elements should not be returned, they might still influence the scoring of enclosing elements, so they should still be indexed, in particular when a propagation mechanism for scoring non-leaf elements is used.

A final strategy,^[25,33] referred to as selective indexing, is to only index those element types with the highest distribution of relevant elements in past relevance data. With this strategy, a separate index is built for each selected element type (e.g., for a collection of scientific articles, these types may include article, abstract, section, subsection, and paragraph). The statistics for each index are then calculated separately. Since each index is composed of terms contained in elements of the same type (and likely comparable size), more appropriate term statistics are generated. In addition, this approach greatly reduces the term statistics issue arising from nested elements, although it may not eliminate it. At retrieval time, the query is then run in parallel on each index, and the list results (one for each index) are merged to provide a single list of results, as discussed in section “Merging.”

It is not yet clear which indexing strategy is the best, as obviously which approach to follow would depend on the collection, the types of elements (i.e., the DTD), and their relationships. In addition, the choice of the indexing strategy has an effect on the ranking strategy. An interesting research would be to investigate all indexing strategies within a uniform and controllable environment to determine those leading to the best performance, across, or depending, on the ranking strategies.

RANKING STRATEGIES

Given an indexed collection of XML documents, the next task of an XML information retrieval system is to return for each submitted query, with or without structural constraints, a list of XML elements ranked in order of their estimated relevance to that query. In information retrieval, retrieval models are used to calculate what is called a retrieval score (usually a value between 0 and 1), which is then used as a basis to rank documents. Many of the retrieval models developed for unstructured text (document) retrieval have been adapted to XML information retrieval to provide such a score at element level (section “Scoring Strategies”). These scores may be used to directly generate the ranked list of elements, or as input to combination strategies required for some indexing strategies in order to rank elements at all levels of granularity (section “Combination Strategies”). For content-and-structure queries, in the context of INEX as expressed by the path-based query language NEXI (see section “Path-Based Queries”), the structural constraints must be processed to provide results that not only satisfy the content, but also the structural criteria of such queries (section “Processing Structural Constraints”). Finally, not all relevant elements should be returned as results, as they may contain overlapping content. This is because of the nested nature of XML documents, which often means that a parent and its child element may both be estimated as relevant, although to a different extent. Some processing is needed to deal with overlapping elements in result lists (section “Removing Overlaps”).

Scoring Strategies

Whatever the representation strategy, i.e., whether all elements or only a subset of them are indexed, a scoring function is used to estimate the relevance of these elements for a given query. With the propagation strategy (discussed in section “Propagation”), the scoring function is applied to leaf elements only, whereas in other cases, it is applied to all potentially retrievable elements. Scoring functions used in XML information retrieval have been based on standard information retrieval models, such as the vector space, BM25, language models, to name a few. These have been adapted to incorporate XML-specific features. As an illustration, we describe a scoring function defined upon a language modeling framework inspired by Sigurbjornsson, et al.^[23]

Given a query $q = (t_1, t_2, \dots, t_n)$ made of n terms t_i , given an element e and its corresponding element language model θ_e , the scoring function expressed by $P(e/q)$ is defined as follow:

$$P(e/q) \propto P(e)P(q|\theta_e)$$

$P(e)$ is the prior probability of relevance for element e and $P(q|\theta_e)$ is the probability of a query being generated

by the element language model θ_e , and can be calculated as:

$$P(t_1, \dots, t_n|\theta_e) = \prod_{i=1}^n \lambda P(t_i|e) + (1 - \lambda)P(t_i|C)$$

$P(t_i|e)$ is the probability of term t_i in element e , $P(t_i|C)$ is the probability of query term t_i in the collection, and λ is the smoothing parameter. $P(t_i|e)$ is the element model based on element term frequency (modeling *itf*), whereas $P(t_i|C)$ is the collection model, for example, based on inverse element frequency (modeling *ief*).

One important XML feature is the length of an element. Indeed, it was shown^[34] that considering element length is necessary in XML information retrieval to cater for the wide range in element sizes. This can be incorporated by setting the prior probability $P(e)$ as follows:

$$P(e) = \frac{\text{length}(e)}{\sum_C \text{length}(e)}$$

where $\text{length}(e)$ is the length of element e . Examples of other XML-specific features used in XML information retrieval include the path length,^[35] the type of an element (its tag),^[36] and the number of topics discussed in an element.^[37]

The size of elements forming XML documents varies greatly. For example, compare a paragraph to a section in a 10-page scientific article. There are likely to be fewer terms indexing the paragraph than the section, leading to a higher chance of a vocabulary mismatch between a paragraph (or any small elements) and a query than between a section (or any large elements) and the same query. In addition, the fact that a paragraph element does not contain all query terms, but is contained in a section element that contains all query terms, is likely to be more relevant than if contained in a section element that does not contain all query terms.

More generally, the context of an element, i.e., the parent, all or some of its ancestors, or the entire document, can provide more evidence on what an element is or is not about. To incorporate the selected context(s) in estimating relevance, the score of an element is modified to include that of its (selected) context(s). The most common technique is to use the document containing the element as context (the document is also an element, albeit a large one, and corresponds to what is being referred to as the root element). This means combining the score of the element to that of the XML document containing that element, where the element and the document retrieval scores are estimated by an XML information retrieval model. The combination can be as simple as the average of the two scores.^[38] A scaling factor can be used to emphasize the importance of one score compared to the other.^[33] This technique (using element and document

scores) has been shown to increase retrieval performance, in particular for long documents, and has been widely used in XML information retrieval.

Combination Strategies

Three of the representation strategies described in section “Representation Strategies” require combination strategies to provide a rank list of all potentially retrievable elements. These combination strategies are propagation (section “Propagation”), aggregation (section “Aggregation”), and merging (section “Merging”).

Propagation

The propagation strategy is needed with the representation strategy that only indexes leaf elements. The relevance of the leaf elements for given queries is estimated on this indexing, resulting in retrieval scores for leaf elements. The relevance of non-leaf elements is estimated through a propagation mechanism, where the retrieval score of a non-leaf element is calculated on the basis of the retrieval scores of its descendant elements. The propagation starts from the leaf elements and moves upward in the document tree structure.

The most common propagation mechanism consists of a weighted sum of retrieval scores. For instance, the number of children elements of an element has been used as a weight^[31]:

$$\text{score}(e, q) = D(m) \sum_{e_c} \text{score}(e_c, q)$$

where $\text{score}(\cdot, q)$ is the retrieval score of an element with respect to query q , e_c is a child element of e , m is the number of retrieved children elements of e , $D(m) = 0.49$ if $m = 1$ (e has only one retrieved child element), and 0.99 otherwise. The value of $D(m)$, called the decay factor, depends on the number of retrieved children elements. If e has one retrieved child then the decay factor of 0.49 means that an element with only one retrieved child will be ranked lower than its child. If e has several retrieved children, the decay factor of 0.99 means that an element with many retrieved children will be ranked higher than its children elements. Thus, a section with a single relevant paragraph would be considered less relevant than the paragraph itself, as it is simply better to return the paragraph as returning the section does not add anything more. On the other hand, a section with several retrieved paragraphs will be ranked higher than any of the paragraphs, as it will allow users to access these several paragraphs through the returned section.

This approach, known as the GPX model, has been very successful within INEX, across test collections and retrieval scenarios. Another successful approach, implemented in the XFIRM system,^[32] is to define the

weight used in the propagation based on the distance between an element and its retrieved leaf elements.

Aggregation

This combination strategy is applied when the representation of an XML element is defined as the aggregation of the representation of its own content (if any) and the representations of the content of its children elements (if any). Retrieval is then based on these aggregated representations. The representation of the element’s own content is generated using standard indexing techniques, whereas an aggregation function is used to generate the representation of the non-leaf elements. The aggregation function can include parameters (referred to as e.g., augmentation factor^[29]) specifying how the representation of an element is influenced by that of its children elements (a measure of the contribution of, for instance, a section to its embedding chapter). Aggregation is to be contrasted to propagation; in the former, the combination is applied to representations, whereas in the latter, it is applied to retrieval scores.

To illustrate aggregation, we describe an approach based on the language modeling framework inspired from Ogilvie and Callan.^[30] There, each element e is modeled by a language model θ_{own} based on its own content. Now assume that e has several children, e_j , each with their own language model θ_{e_j} . Let $P(t|\theta_{\text{own}})$ and $P(t|\theta_{e_j})$ be the probability of query term t being generated by the language models θ_{own} and θ_{e_j} , respectively. The language model, called θ_e , modeling the element e based on its own content and that of its children, is defined as a linear interpolation of language models:

$$P(t|\theta_e) = \lambda_{\text{own}} P(t|\theta_{\text{own}}) + \sum_{e_j} \lambda_j P(t|\theta_{e_j})$$

where

$$\lambda_{\text{own}} + \sum_{e_j} \lambda_j = 1$$

The λ parameters model the contribution of each language model (i.e., element) in the aggregation, here implemented as a linear combination. The ranking of the elements is then produced by estimating the probability that each element generates the query (e.g., similarly to the formulation described in section “Scoring Strategies”). The effectiveness of the aggregation, however, depends heavily on the appropriate settings of the λ parameters, whose values are usually estimated through learning methods.

Merging

The last combination strategy is that of merging, which is needed when a selective indexing strategy is used. With

this indexing strategy, a separate index is created for each selected type of elements (e.g., article, abstract, section, paragraph, etc.). A query submitted to the XML information retrieval system is run against each index separately, resulting in separate ranked lists of e.g., article elements, section elements, paragraph elements, etc. These lists need to be merged to provide a single ranking, across all element types.

In Mass and Mandelbrod,^[33] the vector space model is used to rank elements in each index. Let e be an element and q a query. The following scoring function is used:

$$\text{score}(e, q) = \frac{\sum_{t \in q} w(t, q) \times w(t, e) \times \text{ief}(t)}{||q|| \times ||e||}$$

where $w(\dots)$ is the term weight based on within-element (etf)/query term frequency, and $\text{ief}(\dots)$ is the inverse element frequency. To merge the lists, normalization is performed to take into account the variation in size of the elements in the different indices (e.g., paragraph index vs. article index). For each result list, the element scores are normalized with $\text{score}(q, q)$, which corresponds to the score of the query as if it was an element in the collection run against the corresponding index. This ensures that scores across indices are comparable. The lists are then merged based on the normalized scores.

Processing Structural Constraints

We described so far approaches that were developed and evaluated during the INEX campaigns to rank elements given the content condition of a query. Given a query consisting of terms, these approaches deliver a list of elements ranked according to how they have been estimated relevant to that query. As discussed in section “Query Languages,” content-and-structure query languages have been developed to allow users to specify structural constraints, e.g., “give me a section in an article about XML technology that also discusses in one of its section book search.”

Within INEX, structural constraints are viewed as hints as to where to look to find relevant information. The reasons for this view are twofold. First, it is well-known that users of information retrieval systems do not always, or simply cannot, properly express the content criterion (i.e., select the most useful query terms) of their information need. It is very likely that this also holds for the structural criterion of the information need. For instance, a user asking for paragraph components on “XML retrieval evaluation measures” may not have realized that relevant content for this query is scattered across several paragraphs, all of them contained within a single section. For that user, it may make more sense to return the whole section instead of individual paragraphs. Second—and to some extent as a consequence of the first reason above—there

is a strong belief in the XML information retrieval community that satisfying the content criterion is, in general, more important than satisfying the structural criterion. For instance, even if a user is looking for section components on a particular topic, returning to that user abstract components would still be satisfactory, as long as the content criterion is satisfied.

Two main approaches have been developed to process structural constraints in XML information retrieval following this so-called vague interpretation of the structural constraints in content-and-structure queries. A first approach is to build a dictionary of equivalent synonyms. If, for example, $\langle p \rangle$ corresponds to paragraph type and $\langle p1 \rangle$ corresponds to the first paragraph in a sequence of paragraphs, it would be quite logical to consider $\langle p \rangle$ and $\langle p1 \rangle$ as equivalent tags.^[39,40] The dictionary can also be built from analyzing past relevance data.^[41] If in such a data set, for example, a query asked for $\langle \text{section} \rangle$ elements, then all types of elements assessed relevant for that query can be considered equivalent to the $\langle \text{section} \rangle$ tag. Thus with this approach, if the structural constraint refers to, e.g., $\langle \text{section} \rangle$, then any element that is of type considered equivalent to $\langle \text{section} \rangle$, will satisfy that structural constraint.

A second technique is that of structure boosting. There, the retrieval score of an element is generated ignoring the structural constraint of the query, but is then boosted according to how the structural constraint is satisfied by the element. The element structure and the query structure are compared and a structure score is generated. This structure score can be based on comparing the paths,^[21,24] and/or the tags in the paths.^[42] An important issue here is to determine the appropriate level of boosting, i.e., how much the initial content-based score should be boosted by the structure score.

The above techniques and their variants are mostly used to determine the relevance of an element according to the content condition and tag-based like structural constraints, e.g., “retrieve sections about XML retrieval.” For more complex structural constraints, as allowed by a path-based language such as NEXI, e.g., “retrieve paragraphs about ranking algorithms contained in sections about XML retrieval,” a first step is usually applied, which is to divide the query into two tag-based like subqueries, e.g., “retrieve paragraphs about ranking algorithms” and “retrieve sections about XML retrieval.” Each subquery is then processed according to its content condition, and its tag-based like structural condition as described in the previous two paragraphs. Each subquery results in a ranked list of elements. To generate a ranked list for the whole query, the two ranked lists are compared, e.g., only elements returned for the “paragraph” subquery whose ancestors are contained among the elements returned for the “section” subquery are then retrieved. The final score depends on the implementation of the contain operation, e.g., a simple set containment, or using fuzzy operators.^[43]

Techniques for processing structural constraints were evaluated in the context of INEX, where the relevance of an element was assessed based on content only. In other words, there was no assessment of whether, for instance, a section element was a better element type to return than another element type (if both were relevant according to their content). Also, considering the structural constraints did not usually increase retrieval performance, apart maybe at very early ranks.^[44] This result may however be due to the evaluation methodology. More research is needed regarding the usefulness and the impact of structural constraints for XML information retrieval.

Removing Overlaps

We recall that the aim of an XML information retrieval system is to return the most relevant elements for a given query. Because of the nested structure of XML documents, when an element has been estimated relevant to a given query (by any of the XML ranking strategies presented in this entry), it is likely that its ancestors will also be estimated as relevant, although likely to a different extent. This is because the same text fragment can be contained in several elements along a same path (e.g., a paragraph, its enclosing subsection, the enclosing section, etc). Thus the element itself, its ancestors, and a number of its descendants may be contained in the result list, eventually leading to a considerable amount of redundant information being returned to users, which may not be acceptable to them.^[45]

The outcome of any of the ranking strategies described so far in section “Ranking Strategies” is a list of elements ranked according to their estimated relevance to a given query, without looking at the overlap issue. XML information retrieval systems may have to decide which elements should be returned from a list of relevant but overlapping elements. Several approaches have been proposed to generate overlap-free result lists. Their starting point usually consists of the list of elements returned as results to a query, which they then process.

The most common approach, referred to as brute-force filtering, selects the highest ranked element from the result list and removes any ancestor and descendent elements from lower ranks. The process is applied recursively. This approach relies on the provision of ranking strategies that rank, among overlapping elements, those that should be selected at higher ranks. However, the ranking may not be appropriate for the purpose of returning the list of the most relevant non-overlapping results. This has led to a number of alternative approaches, where the tree structure of the XML documents has been considered to decide which elements to remove from a list of overlapping results.

In the first such approach,^[41] a notion of the usefulness of an element is introduced to decide which elements to

remove. Usefulness is modeled through a utility function defined upon the retrieval score of an element, its size, and the amount of irrelevant information contained in its children elements (implemented as the “amount” of text contained in the non-retrieved children elements). An element with an estimated utility value higher than the sum of the utility values of its children is selected and its children are removed. Otherwise, the children elements whose utility values exceed some set threshold are selected and the element is removed.

An alternative approach^[46] looks at the distribution of retrieved elements in the XML document’s tree structure, in addition to their score, to select the elements to retain. For instance, an element that has many of its descendants retrieved, but which are evenly distributed in the corresponding subtree structure, and in addition has a similar score to the parent element, is selected. This is because already from that selected element, all its descendants, many of which are being estimated as relevant, can be accessed. Otherwise, its descendants are selected to be themselves further processed.

A third approach^[47] calculates a new score for each element on the basis of the retrieval scores of its (if any) descendent elements. This is done through a bottom-up propagation mechanism, using for instance the maximum or average operation to recalculate the scores. These scores are used to generate a new ranked list, which is then filtered by selecting the highest ranked elements, and then removing either all ancestors or all descendants of that selected element from the list (e.g., brute-force filtering). The best performances were obtained using the maximum function and removing the descendants.

Techniques that explicitly considered the document logical (tree) structure to remove overlaps usually outperformed those that did not. There is, however, the issue of speed, as the removal of overlaps is done at query time, thus requiring efficient implementations. An interesting question would be to investigate the effect of the original result list (how good it is, and how we define “goodness”) on the overlap removal strategy. There are indications that a good initial result list, where good depends on the definition of relevance in the context of XML information retrieval, leads to better overlap-free result list than a less good one.^[48]

DISCUSSION

XML information retrieval research is related to work on structured document retrieval. The term “structured document retrieval,” which was introduced by the information retrieval community, refers to “passage retrieval” and “structured text retrieval.” In passage retrieval, documents are first decomposed into passages (e.g., fixed-size text-windows of words,^[49] fixed discourses such as paragraphs,^[4] or topic segments through the application of a

topic segmentation algorithm^[50]). Passages are then retrieved as answers to a query (and have also been used to rank documents as answers to the query). Since 2007, INEX has a passage retrieval task.^[51]

Structured text retrieval is concerned with the development of models for querying and retrieving from structured text,^[52] where the structure is usually encoded with the use of mark-up languages, such as SGML, and now predominantly XML. Examples of pre-XML/NEX approaches include.^[1,3,53] Most of the early structured text retrieval models, however, do not return a ranked list of results. Approaches that were specifically developed for XML retrieval, but still pre-INEX include.^[54–57] A survey on indexing and searching XML retrieval is from Luk, et al.,^[58] and two workshops on XML retrieval held at the SIGIR (<http://www.sigir.org/>) conference were reported.^[5,7] A recent overview on XML retrieval research is from Amer-Yahia and Lalmas.^[59]

Research on XML retrieval significantly flourished since the set-up of INEX, as the latter allowed the evaluation and comparison of XML information retrieval approaches. Nowadays, XML retrieval is almost a synonym for structured document retrieval, or structured text retrieval. In this entry, we described many of the strategies used for representing and ranking XML elements, which were experimented on the INEX test collections. We also described query languages that were developed to access XML documents with respect to both content and structural conditions.

It is not yet possible to state which approaches, whether for querying, representing, or ranking, or their combination, work best, since many factors are involved when deciding how relevant an element is to a given query (e.g., the size of an element, the type of element, the relevance of structurally related elements, the interpretation of the structural constraint, etc.). Indeed, XML information retrieval can be regarded as a combination problem, where the challenge is to decide which evidence to combine and how to combine it for effective retrieval. We can however postulate that considering the context of the element, the size of the element, and the element's own content (directly or using a propagation or aggregation strategy) to estimate that element relevance to a given query has been shown to be beneficial for XML information retrieval. An open research question is the processing of structural constraints, as so far, only limited improvement in retrieval performance has been observed with structure-and-content queries.

The querying, representation, and ranking strategies described in this entry have been developed with the purpose of estimating the relevance of an element for a given query, which is only one retrieval scenario. This may not necessarily be the end task in XML information retrieval. Returning overlap-free results is another retrieval scenario, one where users do not want redundant information (approaches developed for this purpose were described in

section “Removing Overlaps”). Another retrieval scenario investigated at INEX is the relevant in context task.^[60] This task is concerned with returning the most relevant documents for a given query, and within each document, identifying the most relevant elements. Such a retrieval scenario was identified as important, if not expected, in a user study carried out within a software company regarding the benefit of focused retrieval.^[61]

In the relevant in context task, elements from the same documents are grouped together. A system could also create so-called “fictitious” documents, i.e., new documents made from some intelligent aggregation of elements coming from different documents, which is another retrieval scenario, currently receiving increasing attention in information retrieval research.^[62] XQuery Full-Text would be an appropriate language for this task, as it allows the specification of new XML fragments to return as results.

Another retrieval scenario, also investigated at INEX, is the best in context task.^[60] There, the aim is to identify the one and only best entry point in a document, i.e., the XML element, from where one could start reading relevant content. Such a retrieval scenario makes sense with a collection of relatively medium size documents (e.g., Wikipedia documents used at INEX since 2006^[26]).

Although not discussed in this entry, two important issues in XML information retrieval are interface and interaction. Appropriate interfaces are needed to cater for the richer and likely more complex interaction between users and XML information retrieval systems, for example, with respect to expressing content-and-structure queries.^[63] Since 2004, INEX runs an interactive track (iTrack) that looked at interaction issues in XML information retrieval.^[64] One outcome of iTrack is that users did not like being returned (at least too much) redundant information (overlapping results). This led to the development of algorithms specifically dedicated to remove or reduce overlaps (see section “Removing Overlaps”). A second outcome was that users expected to have not only access to relevant elements, but also the context of these elements (e.g., the document containing, or the parent element of, a retrieved element). This led to the proposal of a table of a content shown in conjunction to the element being accessed^[65] or the use of heatmap highlighting relevant elements within a retrieved document.^[66]

Information retrieval approaches developed for querying, representing, or ranking are relevant to applications concerned with the effective access to repositories of documents annotated in XML, or similar mark-up languages. XML retrieval is becoming increasingly important in all areas of information retrieval, and in particular in the area of so-called focused retrieval.^[67] Current applications of XML information retrieval technologies already exist.^[68] An example is that of book search,^[69] which is a research track being investigated at INEX since 2007.^[70]

ACKNOWLEDGMENTS

This entry is based on two other entries on XML information retrieval cowritten by the author, a book chapter on “Structured Text Retrieval” to appear in the second edition of Baeza-Yates and Ribeiro-Neto,^[71] and an entry on “XML Retrieval”^[72] to appear in the Encyclopedia of Database Systems.^[73] The author would like to thank Benjamin Piwowarski and Anastasio Tombros for their comments on this entry.

Young Adult Library Services Association (YALSA)

Marjorie Lewis

Canaan, New York, U.S.A.

Abstract

As part of the continuum of total library service of the American Library Association, the Young Adult Library Services Association (YALSA) is a specific division which mission is to advocate, promote, and strengthen service to young adults ages 12 through 18. The Young Adult Library Services Association celebrated its 50th anniversary in 2007 with, still, a high energy that has drawn to it a wide variety of members: librarians, youth advocates, and publishers. These members participate through the division's many committees and other activities such as publishing, special initiatives, and continuing education activities. The five decades of its existence have been marked by profound alterations in attitudes toward young people in new kinds of media and technology as well as in changes in society. The division continues to note these changes and adds and subtracts where needed. It is a division proud of its abilities not only to keep up but to lead.

INTRODUCTION

As part of the continuum of and commitment to total library service by the American Library Association (ALA), the Young Adult Services Association (YALSA) is a specific division which mission is to advocate, promote, and strengthen service to young adults, ages 12 through 18. The Young Adult Library Services Association celebrated 50 years of dynamism and creativity in 2007. It is now the fourth largest division of the many ALA divisions and its membership is now more than 5600—librarians (both school and public), youth advocates, publishers, and library students. These members have opportunities to participate at all levels of YALSA activities through the division's many committees and other activities such as publishing, special initiatives, continuing education activities, and literary awards. The 50 years of YALSA's existence have been marked by profound alterations in societal attitudes toward young people as well as enormous and ever-changing technological and media advancement. The division notes these changes and adds and subtracts where needed. It is a division proud of its abilities not only to keep up but to lead.

OVERVIEW

In 1957, the Association of Young People's Librarians, which had been established in 1941, split into two divisions: Children's Library Association (CLA) and the Young Adult Services Division (YASD). Mildred Batchelder served as the first Executive Secretary of both divisions. One of the first acts of the two divisions was to defeat a proposal by ALA to absorb "Top of the News,"

the CLA/YASD publication, into its own "Bulletin." In 1961, when the American Association of School Librarians (AASL) was given the right to evaluate, select, and interpret materials for school use, YASD issued a function statement to clarify its role:

The Young Adult Services Division is interested in the improvement and extension of services to young people in all types of libraries. YASD has a specific responsibility for the evaluation and selection of books and non-book materials and the interpretation and use of materials for young adults, except when such materials are designated for only one type of library.

In the 1950s, although the assignment of YASD committees to other divisions often occurred, the new YASD division became increasingly visible within ALA. The Young Adult Services Divisions' annual lists of recommended books were produced and reprinted in ALA publications such as "Booklist" and "Top of the News." When the National Education Association asked YASD to create a book list to serve college-bound students, a committee to fulfill the request was formed and the "Outstanding Books for the College Bound" was born. This list has gone through several revisions and is issued approximately every 5 years. The revisions reflect changing users, social climate, and add new titles and subtract titles no longer valid. In the 1950s, another popular publication was "Bookbait" edited by Elinor Walker.

In the 1960s, the division became more visible to the world outside the library world. In 1964, after a successful conference between publishers and librarians, the Publishers' Liaison committee was formed and first preconference was held in New York City called *Two Blocks Apart*. The preconference addressed the needs of

disadvantaged youth. In 1966, the first attempt to provide guidelines for public library service to young people was published. A Television Committee was also established in the 1960s which created related book lists on request such as NBC's "Teachers' Guide to Television." During National Library Week, in 1968, over 40,000 copies of the book list "Happenings" was distributed published by the Free Library of Philadelphia. At the 1967 Annual conference in San Francisco, YASD sponsored a preconference called *Intellectual Freedom and the Teenager* in conjunction with the Intellectual Freedom Committee of ALA. Another example of outreach to libraries was the availability of attractive and informative slide series showing new approaches to young adult services available on loan to state libraries. The White House Conference on Youth in 1960 included a delegate from YASD, and "Youth in a Changing World" was published and distributed.

In the late 1960s, the ALA Committee on Organization asked the divisions to reexamine goals and activities. Although YASD conducted a membership survey, response was minimal and very little change ensued. They dissolved three committees and formed an Organization Committee to deal with further changes.

The most active committee during this time was the Book Selection Committee that, after several name changes, became the prestigious Best Books for Young Adults committee. The Peace Corps subcommittee prepared special paperback book lists, programs and exhibits, and the Dial-a-Book project at the 1964 World's Fair proved highly successful by promoting one-minute book reviews for young people.

In the volatile 1970s, an invigorated YASD emerged because of a new dues structure by ALA (which had previously given two free division memberships included in an annual membership). The new dues structure allowed the divisions the freedom to operate on an independent basis. In 1975, Evelyn Shaevel, who had been serving only four-fifths time as YASD Executive Secretary, became a full-time staff member. The social changes the country was undergoing were reflected in book lists such as the "Now Scene," one of several new additions to the latest revision of "Outstanding Books for the College Bound." In an effort to add multiculturalism to its list of recommended books, "Richer by Asia" was produced which was funded by the Asia Foundation, and then, with its own expertise, YASD published "African Encounter."

Recognizing the enormous impact of media on young people, a preconference in Dallas in 1971 focused on audio/visual materials, equipment and methods of integrating them into more traditional services. A pamphlet titled "Mixed-Means Programming with Young Adults" was a product of this preconference. The new AV Committee published "Film Profiles for Youth" which emphasized the interest in other media besides books shown by librarians and teenagers. The first cover drawn by teens was featured on the 1974 "Best Books for Young Adults"

list. Also, during that year, an official liaison from YASD was appointed to the Freedom to Read Foundation, and the Publishers' Liaison Committee gathered a list of young adult review sources and sent speakers to regional conventions to talk about young adult books. For the first time, *Top of the News* was available on subscription basis.

Also, in 1974, the Survival Kit Committee produced a list of helpful resources for establishing, promoting, and maintaining young adult services at the local level. In 1975, the Media Selection and Usage Committee established guidelines to create the first annual "Selected Films for Young Adults" list of recommended films. In 1977, the publication "Directions for Library Service to Young Adults" provided guidelines for library service to young adults.

Notable events of the 1970s included the publication of "Look, Listen, Explain: Developing Community Library Services for Young Adults." In 1975, "Book You" was the fourth preconference sponsored by YASD. Participants discussed the titles on the "Best Books for Young Adults" lists of the past 15 years and from them selected the "Best of the Best: Still Alive in '75." This was the beginning of a series of "Best of the Best" preconferences. In 1979, ALA Bylaws were amended to include the election of a representative from YASD to ALA Council.

Even though YASD members voted for a dues increase in 1983, which enabled YASD to establish specific reachable goals and objectives with appropriate strategies to achieve them, YASD did not become self-supporting. Efforts to increase membership continued, however. In 1986, 150 new members were registered after a direct mailing to school librarians publicizing a resolution passed in response to the Department of Education report "A Nation at Risk." The resolution emphasized the roles that librarians working in schools and public libraries play in the personal and educational growth of young adults. Because of scarce financial resources, YASD agreed to participate in an innovative shared staffing arrangement with the Association of Specialized and Cooperative Library Agencies.

To adequately reflect the concerns and interests of the membership, *Top of the News* (TON) was renamed *Journal of Youth Services in Libraries* (JOYS), and, in 1988, the joint boards of the Association for Library Service to children (ALSC) and YASD made JOYS a refereed journal to increase research-related articles and submissions from academia and other scholars.

By the end of the 1980s, YASD's mission statement: "to advocate, promote and strengthen service to young adults as part of the continuum of total library service" was still in use. The division formed new committees to fulfill that mission. They included Intellectual Freedom, Legislation, Selected Films and Videos for Young Adults, Education, Organization and Bylaws, Program Planning Clearinghouse and Evaluation, Recommended Books for the Reluctant Young Adult Reader, Public Relations, Publications, Library Service to Young Adults with Special

Needs, Executive, Budget and Finance, Baker & Taylor/YASD Conference Grant, Computer Applications, Long-Range Planning, Local Arrangements, Youth Participation, Division Promotion, *School Library Journal* (SLJ)/YASD Author Achievement Award (Margaret A. Edwards Award), and Membership Recruitment. These new committees, besides fulfilling needs and goals of the division, offered increased opportunities for membership input and participation.

Reacting to the membership's desire to see genre book lists compiled to appeal to the young adults they served, in 1988 five genre committees were established: Horror, Mystery, Romance, Sports, and Science Fiction. Publication of these lists, for distribution to libraries and other venues, was expedited by the ALA Public Information Office and was partially funded by Baker & Taylor. In 1989, two more committees and subsequent lists were created: Fantasy and Humor. These lists were followed in 1991 by the Historical Fiction list.

Lists of publications produced from the 1980s through the 1990s attest to the vitality and active participation of a membership eager to provide the highest quality guidelines and reader's advisory services to young adults and the librarians that serve them. The publications include:

- 1981—"Young Adults Deserve the Best: Competencies for Librarians Serving Youth."
- 1981—"Cheap CE: Providing Continuing Education with Limited Resources: A Resource Guide."
- 1983—"Youth Participation in Libraries: A Training Manual."
- 1989—"Teen Pregnancy Crisis: Libraries Can Help."

In 1982, grants were established and supported by a variety of funders. The Frances Henne/YASD/VOYA Research Grant of \$500 encouraged the research activities of YASD members. In 2009, this grant was increased to \$1000. The Baker & Taylor Conference Grant enabled two librarians working with young adults (one in a school library and one in a public library) to attend their first ALA conference. In 1991, this grant was increased to \$1000. The Econo-Clad Award (now the Sagebrush Corporation Award) for a Young Adult Reading or Literature Program for \$1000 enabled the winner to attend an upcoming ALA conference. It was first awarded in 1990. Another award was established in 1994 by the Book Wholesalers, Inc. A Collection Grant of \$1000 is given to two librarians to assist them in the development of the collection of resources for young adults in their library.

In 1985, the National Endowment for the Humanities (NEH) awarded the division a grant entitled "Courtly Love in the Shopping Mall" to present four regional workshops to train librarians working with young adults to design and implement humanities programs. In addition, a preconference based on the grant gave participants excellent ways to start such programs in their own

libraries. The Young Adult Services Division received a supplemental grant from the NEH to support an additional two regional workshops.

In 1986, the Allerton Institute focused on library service to young adults. This conference, although sponsored by the University of Illinois, was partially funded by an ALA/World Book Goal award and was titled "Missionaries and Managers: Library Services to Children and Young Adults in the Information Age." The goal of the conference was to assess the current status of library service to young adults and update goals and strategies for meeting the future information needs of youth. That same year the U.S. Department of Education worked with YASD to survey the accessibility of resources and services for young adults in public libraries and resulted in the first edition of "Services and Resources for Children and Young Adults in Public Libraries." The second edition was published in 1995.

In 1988, in collaboration with the Library Administration and Management Association and the ALSC, YASD developed a regional workshop, "Managing Youth Services," which was offered to library systems as a continuing education opportunity. The two presenters for each workshop were Mary Somerville and Vivian Wynn. This workshop was discontinued in 1991.

A new award was developed that would honor an author for lifetime achievement in writing that had lasting appeal to young adults. *School Library Journal* agreed to sponsor the award on a biannual basis beginning in 1988. The first winner was S. E. Hinton for *The Outsiders*. The award brunch was so well received that the YASD Board of Directors decided to make it an annual event. The award was originally called "The SLJ/YASD Author Achievement Award" but was changed to the "Margaret A. Edwards Award" in 1991 in honor of Margaret Alexander Edwards, a young adult specialist at the Enoch Pratt Library in Baltimore, Maryland, for many years and the author of the young adults services classic, *The Fair Garden and the Swarm of Beasts*. Information about the award and past winners can be found at <http://www.ala.org/yalsa/edwards>.

In 1989, the Board of Directors and the YASD Legislation Committee worked on the White House Conference on Library and Information Services II (WHCLIS) developing information packets. The Legislation Committee assisted in writing the paper "Kids Need Libraries: School and Public Libraries Preparing the Young of Today for the World of Tomorrow." This provided the conference delegates with a framework for discussion of issues relating to the improvement of library services for young people in this country. The Young Adult Services Division members and members of other youth divisions as well as other advocates lobbied intensively for the Omnibus Youth Literacy through Libraries Bill as the number one priority from WHCLIS II. When Evelyn Shaevel left YASD to take another position in ALA, the Board of Directors

decided to share staffing with the AASL. Ann Carson Weeks was Executive when Susan Horiuchi resigned, Linda Waddle, a former board member, became Deputy Executive Director of YASD. Also, in 1991, the chairs of the Organization and Bylaws Committee and the Budget and Finance Committee became ex officio members of the Board of Directors. The Board of Directors adopted a proposal that the age definition for “young adults” for the purposes of research was ages 12 through 18. Student dues were also approved. In 1992, after several years of study, the YASD changed its name to the Young Adult Library Services Association, and the new name and its euphonious acronym, YALSA, led to increased recognition within and without the library community; its new identity, image, and name brought a dynamic liveliness to decades of tradition.

From 1994 until 2001, activities, publications, and programs proliferated. Presidents of the division identified themes for their terms of service and presented popular programs based on those themes. A new strategic plan was developed and reflected commitments to three areas: advocacy, coalition-building, and equity of access. The Board of Directors provided impetus and leadership to produce a remarkable array of accomplishments as a single entity and in partnership with other ALA divisions such as ALSC and AASL. New book lists were introduced and updated when needed. A speaker and consultant resource directory was created and, also, updated when needed.

During this period, coalitions with other organizations and divisions further integrated YALSA's work into the larger community of youth service. The Board of directors recommended collaboration with Friends of the Library, U.S.A. to develop a database of teen library groups that became the National Youth Participation Database. The Young Adult Library Services Association connected with other young adult advocacy groups through the National Organizations Serving Young Adults Liaison Committee. With other national entities and divisions, YALSA cosponsored events at the Midwinter and Annual meetings and served as consultants to organizations studying youth issues.

Two events marked the 1990s as a period of innovation and energy—Teen Read Week and the Great Books Giveaway, both of which continue to present day. Begun in 1998 as an initiative in collaboration with the ALA Public Information Office and ALA Graphics, Teen Read Week grew exponentially. The overall theme continues to be “Read for the Fun of It,” and by its 4th year over 1400 schools, public libraries, and book stores participated. At present, it has more than 5,000 registrants and is sponsored and promoted by sponsors such as Mirrorstone Books, which has given large donations, and various publishers. In addition, World Wrestling Entertainment sponsors the WrestleMania Reading challenge project which challenges teen readers to read one book a week for the ten

weeks following Teen Read Week, with the chance to win a trip to WrestleMania. In addition, World Wrestling Entertainment Teen Tech Week, which encourages teens to use nonprint resources at the library, has joined these special events, and various publishers. The Great Book, Giveaway Competition, another creative project begun in the 1990s continues generating visibility for YALSA and much excitement among participating libraries. Libraries that apply are asked to describe their young adult program highlights and needs. They must also have a Board-approved selection or collection development policy. The latest recipient 2009 was the Lincoln County Public Libraries in Libby, Mont. which received a “ton” of books—a huge collection of materials such as children's, adult and young adult books, videos, CDs and audiocassettes, DVDs, etc. that publishers and producers submitted to YALSA for review by the division awards and selection committees, materials estimated to be worth thousands of dollars. The YALSA office received so many materials that a second and third prize was given out in 2009. An emphasis on teen participation, so much a mark of the 1980s and 1990s led to the first-time development of teen-oriented products in collaboration with ALA Graphics. Such items as temporary tattoos, posters, bookmarks and water bottles promoted Teen Read Week, and other events. These products and other YALSA services were promoted via the Internet through the ALA Web site.

Publications proliferated through the 1990s and the 2000s with a variety of revised editions as well as new ones. The Young Adult Library Services Association now produces its own quarterly journal (*YALS*), a quarterly email newsletter (*YAttitudes*) and at least two books a year. In 2008 and 2009, YALSA published *The Official YALSA Awards Guidebook*, edited by Tina Frolund; *Excellence in Library Services to Young Adults*, Fifth Edition, edited by Amy Alessio; *Quick and Popular Reads for Teens*, edited by Pam Spencer Holley; and *Cool Teen Programs for under \$100*, edited by Jenine Lillian.

For the first time since 1981, *Young Adults Deserve the Best: Competencies for Librarians Serving Young Adults* was revised and, in Past President of YALSA Michael Cart's words, aided in “redefining the profession for the 21st century.” Book lists selected by a variety of YALSA committees continued to be revised and distributed. Long-lived annual lists such as *Best Books for Young Adults* and *Quick Picks* were joined by *Popular Paperbacks for Young Adults*, *The Alex Awards*, *Amazing Audiobooks for Young Adults*, *Fabulous Films for Young Adults*, and *Great Graphic Novels for Teens*. Books were made from these lists, including *Best Books for Young Adults* by Holly Koelling, and *Outstanding Books for the College Bound* edited by Marjorie Lewis.

Reading lists to complement the HBO six-program series “Life stories: Families in Crisis” were prepared. *Directions for Library Service to Young Adults* was revised as was *The Fair Garden and the Swarm of Beasts*,

the classic by Margaret A. Edwards. Other publications were *Youth Participation in School and Public Libraries: It Works*, *Hit List: Frequently Challenged Books for Young Adults* and *Excellence in Library Service to Young Adults*. In the works are Annotated Booklists for Every Teen Reader, Multicultural Programs for Teens and Tweens, Risky Business, and Young Adults Deserve the Best.

In 2007, YALSA won an ALA World Book Goal Award to produce the program “Teens Need Libraries.”

In the 1990s, 10,000 generalists and other staff members were trained in order to provide exemplary library service to young adults. The Excellence in Library Service to Young Adults project, begun in 1993, became a triennial event with grants to school and public libraries and a publication highlighting the winning entries. The Young Adult Library Services Association also participated in the ALA conference on Professional Education. Two annual awards were instituted honoring young adult literature the Edwards Award named for Margaret Alexander Edwards is given to an author whose writing for young adults exemplifies the highest quality books for young adults, and the Printz Award for Excellence given to an author whose young adult book is considered to be of outstanding literary quality each year. Other YALSA awards are the Alex Awards for adult books with teen appeal, the Morris Award for debut authors, the Odyssey Award for best audiobook production (co-administered with ALSC), and beginning in 2010, a nonfiction award. These awards have brought increased recognition to those who work with and those who write for ages 12 through 18.

New committees, offering membership greater opportunities to participate in division business were formed and committees that outlived their usefulness were sunsetted during the 1990s. Sunsetted were the Public Relations Committee, eight genre committees, the Econoclad Award Committee, the Baker & Taylor Conference Grant Committee and the Book Wholesalers Award Committee. The grant committees were made the responsibility of some other standing committees. Renamed and Reorganized committees included computer applications which became Technology for Young Adults, Long-Range Planning became Strategic Planning, and Membership was combined with Division Promotion to become Division and Membership Promotion. Recommended Books for Reluctant Young Adult Readers became Quick Picks for Reluctant Young Adult Readers and Selected Films and Videos for Young Adults became Selected Videos for Young Adults — which then became Fabulous Films for Young Adults. New committees included Popular Paperbacks for Young Adults and new award selection committees.

In 1993, *JOYS* benefitted from a new attractive format and a change in editorship. By including speeches from ALSC and YALSA programs, such as those given by

award winners and increasing the pool of referees from 33 to 50, the publication better informed membership about division news and views.

By 2007, seven book and media lists were published: the ever-popular *Best Books for Young Adults (new edition)*, *Great Graphic Novels for Teens*, *Popular Paperbacks for Young Adults*, *Quick Picks for Reluctant Young Adult Readers*, *Amazing Audiobooks for Young Adults*, and *Selected DVDs and Videos*—newly named *Fabulous Films for Young Adults*.

The Young Adult Library Services Association now celebrates Support Teen Literature Day during National Library Week. Beginning in 2008, YALSA will host a Young Adult Literature Symposium every other years partially funded by the Morris endowment. Keeping up with new innovations, YALSA has a blog and a wiki, is known for its electronic discussion lists within ALA and has a distinctive presence on Face book as well as other social networking sites. The Young Adult Library Services Association is considered a leader in advocating safe use of the Internet.

The enormous growth of Internet users throughout the 1990s gave YALSA the opportunity to reach a wider audience of teens and librarians as well as educators and publishers. The Young Adult Library Services Association has had a Web site since 1992 at <http://www.ala.org/yalsa> which includes information about the division, projects in the works, mission and vision statements, publications, and graphics. In 2000, YALSA created the first ALA members-only Web site.

The increasing importance of technology in the 1990s to young adult patrons was recognized by the development of the popular Web site “Teen Hoopla,” and its hits produced book reviews, discussions of issues and numerous links to other sites of interest to young adults. After criticism of “Teen Hoopla’s” link with Columbia University’s Web site “Go Ask Alice,” YALSA united with ALA’s public information office, and other ALA units to defend its action.

In 1996, mission and vision statements were composed to serve as guides for YALSA’s activities, goals and priorities; the vision statement, in fact, served as a model for other ALA divisions. These statements together were the basis for a strategic plan adopted by YALSA’s Board of Directors in June 1997. The plan’s key concepts of advocacy, coalition and equity of access became YALSA’s guiding principles directing the division’s plan of action for the next 4 years until 2000 when, inspired by ALAction 2005, a new strategic plan was adopted with six key action areas:

- Action
- Coalitions
- Twenty-first century literacy
- Diversity
- Equity of Access

In its strategic plan, YALSA mapped out its mission, vision, and specific strategies for action. The plan took a look at strengths and weaknesses of the division. Among its strengths, it acknowledged the high level of member participation, the diversity of its leadership and its openness to change and experimentation. Among its weaknesses it listed its aging membership, lack of research into the effectiveness of its book lists, too small a staff and lack of sufficient revenue. In describing environmental opportunities, the report mentioned the changing face of ethnic United States, a great growth in the number of high school students by 2009, a gradual banding together of services to young people and the value of the Internet for global involvement. In looking at environmental challenges, it recognized that young adult services suffer from low visibility, the unwillingness of school libraries to coordinate efforts and the lack of enough librarians to serve young adults at a time when such librarians' special training is increasingly important.

In 2001, *JOYS* stopped publication when *Young Adult Library Services*, a quarterly publication, was launched. In 2002, *YALS* began. In 2003, standards for serving teens in

libraries were published. The 2000s also saw a YALSA mentoring program which paired experienced librarians with new young adult specialists.^[1]

The Young Adult Library Services Association's momentum continues to rise — its 50th year sees an increased passion to serve young adults! That energy and dynamism exemplifies the resurgence of interest in teens, adolescent literacy and the importance of library service to those teens, one of the fastest-growing segments of the population. It gives training and guidance to librarians who serve young adults and has become a widely respected knowledgeable partner to other organizations and agencies who work with young adults. The division offers the members enormous opportunities to hone their leadership skills so that they can become leaders in their libraries and in the larger library world.

Abstract

Highlighting the major components of young adult services, this entry discusses adolescent development, staff, collections, group programs, space, and major issues impacting the service such as censorship, mass assignments, parents doing homework, and technology.

INTRODUCTION

“Young adult (YA) services” is the term used to describe a variety of library services tailored to the adolescent clientele, primarily those young people in middle, junior high, and high school, or between the ages of 12 and 18, regardless of setting, although the term is most commonly used to describe public library services.^[1] While library attention to adolescents actually dates from Caleb Bingham’s gift of books to the Bingham Youth Library in Salisbury, Connecticut in 1803, a cohesive service perspective only began when Anne Carroll Moore, fearing that all her good work in the children’s rooms of the New York Public Library (NYPL) was not continued in the adult departments there once children graduated from eighth grade, hired Mabel Williams to work with the high school clientele in NYPL’s Office of Work with Young People. Secondary schooling was not mandatory then, but as more high schools were established, Moore saw them as a way to continue personalized service to young people through outreach and collaborative activities.^[2,3]

Since YA services grew out of children’s services at a time when books and reading were the predominant recorded means of learning and understanding the world, reading and reading promotion traditionally remain a large part of what the service is about. This continued emphasis can be seen both in the array of committees and in the activities surrounding Teen Read Week in the American Library Association’s (ALA) Young Adult Library Services Association (YALSA) devoted to identifying and promoting books of interest to, or worthy of acclaim for adolescents, in various categories.^[4] In Moore’s time, there were no juvenile publishers involved in producing books specifically for adolescents, and YA services librarians spent their time identifying adult books of particular interest to teen readers. Since then, changes in publishing and in the formats available for library collections, as well as the growth and influence of mass media and the Internet on

the YA audience, have extended the nature of what is included in library collections purchased for young adults.

The public library bias of young adult services not only stems from the fact that many of the pioneers in this service, such as Mabel Williams and Margaret Scoggin of the New York Public Library, Margaret Alexander Edwards of the Enoch Pratt Free Library in Baltimore, and Jean Roos of the Cleveland Public Library, were all public librarians, but also because tax-supported public libraries predate tax-supported school libraries historically in the United States.^[5] The service also predates the ascendancy of the reference/information paradigm within the profession at large, with Edwards in particular being emphatic about library services doing more for adolescents than helping them in the mindless pursuit of facts, which is how she viewed reference services, a view largely discounted or ignored by contemporary YA practitioners. This bias is further exacerbated because of the pronounced differences between public and school library services that have emerged because of the influence of technology on the learning process in schools and also because of the national standards for school libraries promulgated by ALA’s American Association of School Librarians (AASL). These standards downplay reading promotion at the secondary level of schooling in favor of information literacy instruction as the primary role of the school library media specialist.^[6]

These institutional differences vary widely in specific circumstances though, in part because only a minority of large public libraries have librarians with the title, “young adult specialist” on staff, even though they serve the age group. Other common staffing configurations include extending the children’s services staff to include young adolescents in their service clientele and renaming the department “Youth Services”; assigning the service responsibility to the adult services staff on the rationale that YA interests were more adult, or that they use more adult materials, than children’s.^[7]

THEORETICAL FOUNDATIONS

While services for young adults share other theories that inform library practice, YA services are primarily supported by theories and research on the physical, social, cognitive, and psychological development of adolescents. Young adult services emphasize how library service can augment various internal and external assets that promote positive youth development in the categories of support, empowerment, boundaries and expectations, constructive use of time, commitment to learning, positive values, social competence, and positive identity.^[8] Long before a recent Gallup poll asked U.S. young people how many of them were experiencing the five promises identified by America's Promise, young adult services were helping provide caring adults, safe places and constructive use of time, a healthy start and healthy development, effective education for marketable skills and lifelong learning, and opportunities to make a difference through helping others.^[9] In many ways, YA services are the most client-centered of library services because they are grounded in the nature of their contemporary adolescent audience.

THE YOUNG ADULT SERVICES AUDIENCE

Definitions

The profession lacks an agreed-upon professional definition of "young adult" that is congruent with individual library service histories or school district divisions. In most public libraries, for example, middle school students (grades 6–8) are a shared constituency between children's and adult or young adult departments, depending on where the YAs present themselves whereas for any particular middle school, those are the only people there. ALA's Young Adult Services Association defines young adults as people between ages 12 and 18, but there are ongoing discussions within the Division about whether the audience focus needs to be expanded to include either tweens or older teens and 20-somethings or both.^[10]

While the YALSA definition quantifies the intended YA service population by age, it is less helpful in terms of the social psychology of, and communication with, adolescents to explain library services for and problems with the age group for librarians. Adolescents do not easily fit the neat categories that libraries and the larger society create for them. They want a say in what happens to them, while often lacking the experience or resources to influence events. They are also a highly stigmatized group who arouse deep suspicion in adults who tend to misread their appearance and are often more interested in controlling them rather than either listening to, or serving them. Since most adults that YAs come in contact with outside their families seem to have total amnesia about or only an

idealized memory of their own adolescence, current young adults cannot always count on them for any kind of residual empathy in or outside of libraries. Thanks to compulsory schooling and laws regarding the age at which one can leave school and work, plus the advanced preparation necessary for many highly paid jobs, there often seems to be no adequate social place for young adults in the United States outside schools, despite a developmental need for social and intellectual competence within a highly sexualized and commercial mass culture. This is a gap that good young adult services attempt to fill.

Adolescent Development

The following is an overview of adolescent development which is the basis for young adult services, with examples of how these characteristics relate to what young adult librarians do. It is important to remember that developmental characteristics can occur at different times even within the same or same-aged individuals. Social characteristics are mediated by culture, so the following generalizations can only be understood for individuals within actual social contexts. Except for the connections to library and information practice by the author, all of these developmental characteristics are drawn from the work of Jean Piaget, Lawrence Kohlberg, Joseph Adelson, David Elkind, Gisela Konopka and Joan Lipsitz' work at the Center for Early Adolescence. They can be found in any adolescent development textbook. A particularly useful book is *Adolescence: The Survival Guide for Parents and Teenagers*.^[11] There has been research on the teenage brain, suggesting that remarkable changes occur during this period; however, there is little agreement to date on the applicability of this research to practice. A summary of this research appears at <http://www.nlm.nih.gov/publicat/teenbrain.cfm>.^[12]

Physical

Early adolescence, roughly ages 10–15, is the second greatest time of growth velocity in human development. Height, weight, and secondary sex characteristics all grow or become obvious at this time. As one young person put it, "Adolescence is when you grow hair and smell bad." This is also the time at which young people reach reproductive maturity physically. Since physical growth is highly variable, even within the same age or grade, there is much angst among adolescents over what is normal and what is not. It is also disconcerting for many young adults to find themselves taller than their parents, for example, or for the girls to be taller than the boys of their same age cohort. It is worth noting that young adults who are "early bloomers," that is, those who mature physically earlier, are at risk in several ways. Girls can draw unwelcome attention from older boys while still lacking the social skills to cope with the attention; boys who are early

developers often do not develop other aspects of their personalities. Physical “late bloomers” suffer from being regarded as childlike, when often, their cognitive abilities are superb. Science fiction conventions seem to specialize in bright adolescent late bloomers, for example.

Cognitive. Adolescence is the time during which a move into formal operational thinking occurs, if it occurs at all. This is the ability to hypothesize about something which has not yet been experienced and is tied to the development of higher order ethical and political thinking because it helps people to understand abstractions. This thinking ability is what allows young adults to dream about and work toward possibilities. It is also the reason why speculative stories such as science fiction, fantasy, and horror are so popular with young adults. It is not inevitable that everyone will reach formal operational thinking, and many people, even when they do, do not reach this stage of cognitive development until their early twenties. Besides the link between this level of cognitive development and media interests, there is also the problem of adults expecting abstract thinking from people who may not be capable of it. This is where serious misinterpretations of behavior are likely to follow.

Psychological. The overwhelming adolescent quest is identity—that is, figuring out who one is, while at the same time reevaluating familiar relationships with parents, siblings, and friends from new perspectives, while encountering many “first” experiences. Adolescent psychology basically takes two forms, which are related. The first is the “personal fable” in which the young adult feels that he or she is alone in the universe and is experiencing events for the first time. Only experience tempers this, but in the meantime, this can lead adolescents to feel invincible, and make it very difficult to get any cautionary information through to them to mitigate risky behaviors. This is why, for example, so many books in YA collections are written in the first person from the perspective of teenage protagonists.

The second facet of adolescent psychology is called “the imaginary audience.” Young adults feel that everyone is looking at them. This makes them extremely self-conscious in many social circumstances, especially when they experience some unanticipated bodily function, such as sudden pimples or spontaneous erections or the emergence of breasts, or when they are ignored in service encounters. This is also why many adolescents have a particularly difficult time with cyber-bullying, which seems to have become a negative effect of new technologies.

Adolescents are exceptionally self-conscious, in part because of changes to their bodies, or in the case of “late bloomers,” the long time it takes for the changes to start. This egocentrism is encouraged, not only by the age segregation experienced by adolescents in U.S. culture, but also by media targeted to adolescents as a consumer class.

Since many adolescents have little real work and intergenerational experience outside their families or schools, it is easy for them to feel that they are heroes in their own “personal fable,” and therefore invincible in terms of various risk-taking activities. One of the more difficult information sharing activities with adolescents is figuring out how to cut through this psychological shield of invincibility to help them take risks within safe boundaries. It is hardly accidental that the Extreme Sports Games are primarily composed of adolescent competitors.

Social. Adolescence is the time that young people move (or are thrust) outside the protective influence of the family into the interdependent relationships of the larger community to test and reconfigure their identities while moving into increasingly adult roles. Relationships are very important during this time. Besides figuring out romantic and sexual relationships with the opposite or same sex and renegotiating power relationships with parents and adult authority figures, adolescents depend on friends to help figure out what is and is not normal with all the changes going on in their lives. Librarians are often dismayed by adolescents in groups, but this behavior is developmentally normal; whereas the lone, seemingly friendless young adult who, while possibly more palatable in libraries, is also more at risk. This need to keep in touch with friends is also the developmental force behind young adult preoccupations with text messaging and Internet Web sites that promote social interaction such as MySpace and Facebook. E-mail is considered a technology for “old people” by today’s teenagers. Unfortunately, dependence on friends can become exaggerated when no strong parental bond exists and also because teenagers, especially those who are racial or ethnic minorities, are highly stigmatized in U.S. culture, except for when they can be slotted as “consumers.”

Structural age segregation separates young adults from both adults and younger children outside the home, through work limitation and mandatory schooling laws. As a result of this, young adults display all the characteristics of a subculture with specific symbols, such as clothing and language, to delineate that status. These subcultural symbols, often inspired by celebrities, are frequently misinterpreted by adults, including librarians, and often lead to unpleasant confrontations in retail settings or misunderstandings with the police. Age segregation has another effect, too, which is increasing lack of access to caring adults. Adolescents cannot mature by themselves, and librarians serving as caring adult role models for them is considered a normal and attractive part of young adult services. There are also many examples of intergenerational YA services that address this issue.

The social “place” designated for young adults is school. Here they are supposed to become critical thinkers and inquirers, developing both lifelong skills for navigating an increasingly complex information society, and

deciding what kind of career they wish to pursue. Some actually achieve these things, but more often, they encounter “imposed queries” they are ill-prepared to negotiate. The very technology they love to play with outside school does not prepare them for the informed demands of information technology within school, hence the almost total preoccupation of the school library section of the profession with information literacy instruction.

Emotional. Mood swings are common in adolescents, partly because of hormonal changes and partly as a result of many first experiences, such as falling in love, for example. The swing from euphoria to depression can be very swift and disconcerting to adults, especially parents. Fears of imagined or real experiences are common, and only diminish as the young person acquires enough life experience to be able to distinguish among events where a likely emotional reaction is appropriate. This is why, for example, early adolescents are much more outraged at discriminatory treatment than senior high counterparts who are better able to think about alternative explanations for the behavior in question.

THE YOUNG ADULT SERVICES PROGRAM

Young adult services in public libraries usually consist of staff, a YA advisory group of some sort, collections, space, policies, group programs and outreach efforts to parents, schools, other libraries, and community youth organizations. Young adult services in schools consist of staff, collections, space, policies, an instructional program, collaboration with teachers and other librarians in the school district, and outreach to local public libraries and the school’s parent association.

Staff

There are actually very few public library positions with the title “Young Adult Librarian,” because only large libraries have them. Services are delivered by adult or children’s librarians in smaller places. Other public libraries have amalgamated “youth services” departments where children and young adults are served by the same staff from birth through early adolescence. The specific services offered to young adults may depend on the boundaries imposed by a particular position description and also where the librarian is organizationally situated. Secondary school librarians are usually credentialed as teachers as well as librarians.^[13,14] One of the myths about being a young adult librarian is that the person has to be young. This is not true; regardless of age, there is general agreement that the person must be mature, technically competent as a librarian, understand and genuinely like teenagers, have good interpersonal skills, and have a good sense of humor. For school library media specialists,

formal teaching skills are also important, but informal teaching skills are equally important for public librarians because of the various information technology learning curves encountered among users. Librarians working with young adults need to be able to have collegial relationships with other adults as well as excellent service skills with young adults, since a large part of YA services is advocating for YA needs with colleagues.^[15,16]

Young Adult Advisory Groups

Since their new cognitive abilities often make them question everything, young adults want input into what libraries do for them because they want to know why these services are being offered. Also, their interests can be so fleeting that it is difficult for librarians to keep up. The response to these needs has been the almost universal establishment of YA advisory groups in public libraries, and some in schools. The groups vary in focus, but basically serve as idea-generators, communication conduits, publicity helpers, program volunteers, collection evaluators, advocates for library services, staff trainers, etc., anything needed to keep the library on track in terms of their age group. Young adult advisory groups also offer youth participation opportunities to local adolescents, and as such, are a YA service in themselves.^[17]

Young Adult Collections

For personal reading

Since contemporary adolescents are, in general, the most “wired,” multimedia generation ever, YA collections should be multimedia themselves. Many school library collections stay within the limitations of curriculum support, but public libraries tend only to have print collections of books and magazines for young adults, with other formats such as music, audio books, DVDs, computer games, etc. representing their interests in other sections of the library that YAs also have access to. Ideally, all items of interest to young adults, regardless of format, would be housed together, but this often proves difficult because of the overlap between YA and adult interests.

Another problem with YA collections is the public library’s philosophy about separate collections. Some do not have separate YA collections at all; others interfile all juvenile materials with adult; some only interfile nonfiction, etc. There is a wide variety of YA collection locations within public libraries, but it should be noted that young adults do not necessarily limit themselves only to what collections are labeled “YA,” regardless of location.^[18]

It is still conventional wisdom among many YA services librarians and publishers that a “YA book” is a mass-market sized paperback, since the format is by far the most preferred by adolescents for reading in book form;

however, with the development of and subsequent inclusion of graphic novels in YA collections, it may now be equally true that a “YA book” is a graphic novel. The importance of this format for young adults was established first with a standing-room-only audience at a preconference on graphic novels sponsored by YALSA at the ALA annual conference in San Francisco, which, in turn, led to the establishment of a standing YALSA committee to determine the “best” graphic novels for young adults annually, followed by the selection of the graphic novel, *American Born Chinese*, for the 2007 Printz Award. The importance of the format is also underscored by research on boys and reading that points out that many of them love comics, making graphic novels a natural reading progression.^[19,20]

Thanks to the establishment of the Printz Award for literary quality by YALSA in 1999 in memory of beloved YA librarian Mike Printz, of Topeka West High School in Kansas, books published specifically for young adults now receive new respect from publishers, authors, and librarians alike, while increasing both the literary sophistication and the range of stories available for the age group. In addition to titles published specifically for young adults, however, YA collections and reading interests extend well beyond the “YA” category of publishing, as documented by the adult titles of interest to young adults selected annually by the Alex Award Committee of YALSA, named for Margaret Alexander Edwards, the first YA Coordinator of the Enoch Pratt Free Library in Baltimore. Many of these titles are subsequently produced by audio book publishers and offer opportunities for young adults who are aural learners or reluctant readers. Young adults also form a major segment of the reading audience for adult science fiction and fantasy stories, whether in print or video formats.

For specific information-seeking

While school libraries include printed reference materials and subscribe to electronic databases of particular usefulness for curriculum-supported research by young adults, public libraries usually house such materials in the adult reference department and allow young adult use there, unless the library has a separate homework center or YA space with its own separate computer access. There is a growing research literature about YA information-seeking in conjunction with school assignments that can be summed up by saying that, without instructional intervention, many young adults may be great surfers of the Internet, but they do not how to search and evaluate what they find, nor do they respect intellectual property. In terms of personal or “everyday” information-seeking by young adults, peers are a preferred source of information with many adults often perceived as not helpful unless adolescents perceive them as both expert and accessible.^[21,22]

Young Adult Spaces

An important trend in young adult services is how to create separate spaces, primarily within public libraries that respond to YA developmental, cultural, and aesthetic needs, although at least one study has also examined school libraries. As Anthony Bernier puts it, “Young adult areas need design elements to harmonize with the way teens sit, study, relax, read, and socialize.”^[23] Inspired by Teen’Scape in the Los Angeles Public Library and Teen Central in the Phoenix Public Library, this interest has led so far to new theories of spatial organization, an ongoing column presenting YA spaces in *Voice of Youth Advocates* (VOYA) and a book by Kimberly Bolan now in its second edition.^[24] The teenager’s need to lounge and eat and socialize while working is finally being recognized architecturally in libraries, although undoubtedly, not every librarian is happy over this trend.

Group Programs

While young adult services are similar to library services for other age groups in terms of offering one-on-one reference and readers’ advisory service, one of the major accomplishments of young adult services is group programs, especially where the young adults themselves help plan and deliver the program. Since several hallmarks of adolescent development are learning that one is both normal and part of a particular generation, and learning how to relate to the opposite sex, any learning activity that allows teens to interact with each other or with other generations becomes an important information service, whether it is a teen talent show, a tutoring program, discussion programs, workshops, etc. The sheer range of young adult services programs is an ongoing topic on several YALSA electronic lists, highlighted annually in VOYA, summarized in five volumes of *Excellence in Library Services to Young Adults*, and summarized in a “best practices” overview.^[25–30]

ISSUES IN YOUNG ADULT SERVICES

Censorship

Young adult materials and services are frequent targets of adult censors, partly as an ongoing product of the larger “culture wars” in the United States, but also because YA interests frighten or offend many adults who would prefer that young people not know or be interested in the topic or format. There are many people, including many librarians who sincerely believe that information may be harmful to youth; whereas, the profession has taken the position that getting information is a positive activity. The problem inevitably arises when young adults want information that some adults do not want them to have. Graphic novels, for

example, come under scrutiny because many adults still consider comics to be “trash” and not worthy of library collections, and also because many of the imported Japanese graphic novels are published for adults in Japan and are not particularly sensitive to American notions of what should or should not be in books for minors. Just a brief perusal of ALA’s most challenged lists shows a high percentage of popular titles aimed at young adults as well as the old standby, *Catcher in the Rye* by J. D. Salinger. While sex and “bad” words will still cause controversy such as Judy Blume’s *Forever*, censors are also concerned about disrespect for adult authority as depicted in *Killing Mr. Griffin* by Lois Duncan, anything that presents homosexuality in a neutral or positive way, such as *Arizona Kid* by Ron Koertge, or the depiction of the rape scene in Stephen Chbosky’s *Perks of Being a Wallflower*. Caroline Cooney’s *Terrorist* has been challenged ever since 9/11, usually by people who have not read it but object to the title. The wildly popular Harry Potter series has been challenged for catering to the occult. A list of the reasons for all censorship challenges compiled by ALA between 2000 and 2005 include anti-ethnic, insensitivity, racism, sexism, homosexuality, nudity, sex education, sexually explicit, antifamily, offensive language, political viewpoint, religious viewpoint, unsuited to age group, abortion, drugs, occult/Satanism, suicide, violence, or inaccurate.^[31]

Young adult librarians need to be prepared to defend decisions made in accordance with selection policies at any time, either orally or in writing, while at the same time respecting the free speech rights of the person disagreeing with library policy. Guidance for doing this is available in toolkits from ALA’s Office for Intellectual Freedom and YALSA’s *HitList* publication.^[32,33]

Censorship challenges are not limited to books, however, but also to music and visual images, as well as to information gathered from the Internet on library terminals. Since many library users serve themselves on Internet terminals rather than go through librarians, adult concerns over youth viewing pornography have led many libraries to institute “acceptable use” policies where users sign an agreement not to visit such sites. This solution did not placate adults who wanted youth access controlled, so a law mandating electronic filters on all library terminals accessible to anyone under 18 in public libraries that received federal E-rate funds (raised by tax surcharges on phone lines) was approved by the U.S. Supreme Court. Prior to that ruling, many school districts already filtered terminals, which can lead to problems for young adults when using Internet connections in school libraries for research, since useful sites get filtered along with those deemed “inappropriate.” The problem with many filters is that they are not able to be turned on and off easily, and they depend on language or image screening methods that are imprecise. For example, a perfectly good photograph of a breast for the purpose of illustrating breast cancer is as likely to be filtered as erotic images of the same body part.

The other problem with filters is that, since their programming is proprietary, librarians cannot always find out on what basis filtering decisions are made. Filtering companies also sell to home users, and what may be fine in a very conservative religious home is probably not appropriate in a public institution used by everyone.^[34] Censors, however, usually generalize from their own worldview, assuming that everyone does or should believe exactly what they do. A good young adult librarian is one who is well-prepared to respond to challenges with good policies for selection and services, due process protections for public response and input, and also has good communication skills as well as the support of library or school administration and significant adult community members.

Young Adult Behavior

Congregating in groups

Young adults congregate in public places, libraries among them.^[35] This is normal, inevitable teenage behavior that allows teens to socialize, flirt, make friends, etc., outside parental view. Most libraries, however, are constructed with solitary intellectual pursuits in mind, and normal young adult behavior winds up being labeled “disruptive” and viewed as aberrant in that setting. Adolescents talking with their friends is actively discouraged and disparaged in several ways through arbitrary restrictions on the number of people who can sit at tables at any particular time, the prohibition of chat room use on Internet terminals, the absence of group study rooms, the prohibitions on meeting room reservations by age and use, and the type of architecture and furnishings chosen when libraries are being built. Librarians seem to feel that making a library look like a study hall will make users act like they are in one.

Young adult librarians then have to enforce one-size-fits-all behavior rules with teenagers who, by definition, do not fit the rule. In one-room libraries, admittedly, group behavior can be a problem, but larger libraries often have the option of designating quiet vs. noisy areas. Both school and public libraries often have conference or meeting rooms that can be opened for groups of young adults to work together. As Thomas has observed, “This approach essentially privileges users for whom learning is understood as individual and task-oriented, and disaffirms activities which could be considered as cooperative, social, or reflective.”^[36,37]

Reference queries

The expressed information needs of adolescents in public libraries tend to cluster primarily around homework assignments which forces many teenagers to look for information on the same topic. This is the so-called mass assignments problem. Although this is an ubiquitous problem for public libraries, many librarians merely complain

about it and scapegoat school librarians for “not doing their job,” with little understanding of what school media specialists actually do. Planning for mass assignments by contacting local schools for curricula, buying multiple copies of needed items, creating temporary “reserve” shelves, creating pathfinders, and calling teachers when needed, even in the face of documented public support for the public library’s taking a formal educational support role.^[38]

The professional literature on information-seeking behavior until recently did not acknowledge that there is a class of questions that do not originate with the person asking them, so-called imposed queries, or that the person forced to ask may be less than interested in the topic of the query. Nearly all homework-related questions fall into this class.^[39]

Adolescents inevitably present themselves at the last minute (because they are still learning how to be future-oriented using their new thinking abilities), with homework questions on topics they do not fully understand or care about, often unprepared to find the answer without more help than most busy public librarians are prepared to give them.

The idea that a public librarian should also be an information literacy instructor is just beginning to take hold in the field, because changing technology has changed the learning curve for everyone and made them all “adolescent users” in some fashion. This is why many public libraries have decided to offer homework centers or some sort of formal educational support besides one-on-one reference service which usually cannot bear the brunt of doing information literacy training in this fashion without breaking down under the numbers needing it.

The problem created by imposed queries for the reference encounter is further complicated by the lack of agreement among reference librarians on whether the librarian just gives users the desired information or whether the librarian just starts users on the path toward finding it for themselves and tries to teach users how to search for the next time they need something.^[40] There is some hypocrisy in the way in which this unresolved dilemma is visited upon adolescents, though. Most librarians in public libraries automatically assume that all homework assignments presented by adolescents are intended to teach the user how to use the library, as opposed to any queries from adults, regardless of the fact that there is little evidence used to support this supposition. This causes the “just-get-them-started” method to be used almost exclusively (and punitively) with adolescents until it becomes obvious that the teenager does not know how, nor will be able to do the assignment without more instructional help in accessing and evaluating library resources.

Adolescent reference queries also come through surrogate users in the form of parents trying to help their children with their homework. These parents are often frustrated themselves over having to do it, and frustrating

to librarians because they do not fully understand what is needed, leaving the librarian never sure whether the correct question has been answered. The situation is even more frustrating when the parent and teenager appear together, and the parent does all the talking for both of them. This situation is also ubiquitous in public libraries.

Preference for and use of technology

As Elaine Meyers points out in her classic article, “The Coolness Factor,” young adults love the Internet, (90.3% having access from more than one location in 2007), and they are very frustrated with the scarcity of familiar technology in libraries.^[41] They hate waiting in line for computers they can only use for short periods of time, and the genders use the Internet differently. To attract this age group, a library needs to understand teenage Internet use and offer information and access using Web-based technology as a conscious part of young adult services. This might include reference service available through instant messaging, a library presence on social networking sites like MySpace or Facebook (used by 55% of teens in 2007), posting library and library-sponsored teen videos to YouTube, full text databases for research, a YA presence on the library Web site with YA input for its design and content, a computer gaming club or programs, downloadable music and book formats compatible with the most popular recording devices used by young adults, if possible, and participatory formats such as wikis and folksonomies.^[42–44]

CONCLUSION

Young adult services remain an important component of overall library services because of the importance of a developmentally sound response to this stage of life. All secondary school libraries are “young adult services” by definition and many public libraries serve young adult users in multiple organizational and staffing formats. However the services are delivered, they must encompass the presence of caring and technically skilled adults who understand adolescent development and can advocate for the age group wherever needed in library bureaucracies. Young adult services include materials collections in the formats most desired by contemporary adolescents, relevant and topical group programs responsive to local teen interests, youth participation in service conceptualization and delivery, and access to information and communication technology. Young adult services are vibrant and fluid, very much like the audience served. Young adult services exist to serve the information needs of adolescents in the present with an eye toward the future adults they may become.

Youth Information: Needs and Behavior

Melissa Gross

School of Information, Florida State University, Tallahassee, Florida, U.S.A.

Abstract

The information needs and behavior of youth is a research area that continues to be ripe with research questions. Work investigating these users has been informed by theories of development from the field of psychology as well as models and theories of information behavior developed in the field of library and information science. Much of what is known about youth information needs and behavior is focused on the context of school and the use of electronic resources. While a body of work is accumulating related to information seeking in school and information seeking with electronic resources, there are significant gaps in our knowledge and methodological issues that need to be addressed to build a solid research base. Youth information seeking in information spaces outside of school, the place of various media in youth information seeking, and the information needs of very young children are particular topics that need to be addressed. Increasing use of theory and the inclusion of youth in research are two ongoing trends that will strengthen understanding of young people's information needs and behavior as well as inform the development of information services, systems, and resources that better respond to the needs of this diverse population.

INTRODUCTION

The information world of youth has long been defined by adult perceptions of youth information needs and adult prescriptions concerning how these needs are best met. In the early 2000s, this started to change as the voices and active participation of young people were increasingly included in studies focused on understanding what young users want to know and how they would like information resources, services, and systems to be configured. Youth information needs and behavior is an active area of study that still has much to achieve before it can provide a full picture of the diversity of needs, skills, and interests of youth as well as how these operate within the various contexts in which information needs and behaviors operate. Research in this area remains scattered and limited by research designs that are not generalizable. Many investigations have small sample sizes and with few replications or follow-up studies.^[1–3] Furthermore, minimal differentiation between subsets of this population, based on developmental levels, is made in terms of subjects chosen to participate or in the analysis of the data. The result is that we cannot speak easily about the information behavior of youth at specific age levels. Even though interest in this research area continues to grow, there are still more questions than there are researchers to address them.^[4] For these reasons, a comprehensive understanding of youth information needs and behaviors has yet to emerge.

This entry provides an overview of what current literature has to say about the information needs of youth, predominate theories and models that inform this literature, and a summary of current understanding of youth

information behavior. Youth, in this discussion, includes both children (birth to age 12) and young adults (age 13–19). The definitions of information need, information seeking, and information behavior are adopted from Case.^[5]

An information need is a recognition that your knowledge is inadequate to satisfy a goal that you have. Information seeking is a conscious effort to acquire information in response to a need or gap in your knowledge. Information behavior encompasses information seeking as well as the totality of other unintentional or passive behaviors...as well as purposive behaviors that do not involve seeking, such as actively avoiding information.

(p. 5)

YOUTH INFORMATION NEEDS

Youth is an extremely broad category involving the full range of human development and requires consideration of developmental level (physical, cognitive, social, etc.) as well as the attainment of a variety of skills, such as reading, writing, and increasingly, information literacy and information and communications technology (ICT) skills. In addition, competency in content areas such as math, science, health, finance, and civics is increasingly important today. Investigations of the information needs of youth have been mainly pragmatic, rather than driven by theory, and based on adult assessments of what the data mean, rather than seeking to understand information needs from the user's point of view. Where developmental

theory has been brought to bear in the research area, a common approach is to incorporate understandings of cognitive development from the field of psychology, such as those provided by Jean Piaget, Erick Erickson, Abraham Maslow, and Lev Vygotsky as a structure for the investigation or as an aid to data analysis. Models of information seeking behavior are also used as frameworks in this literature and are discussed further in the following.

Due to the vast developmental differences from birth to age 19, it is clear that adults play a central role in the information worlds of youth, especially for the very young. The identification of information needs, as well as the ability to satisfy them, cannot be completely divorced from adult views of what is appropriate for youth as well as adult interest in making information accessible or inaccessible.

One approach to understanding the information needs of youth has been to categorize the kinds of information youth need. Walter,^[6] based on in-depth interviews with informants such as teachers, scout leaders, ministers, and other adults interested in children, suggests that adults are not necessarily conscious of their role as information providers to youth and that much of the information children need does not get to them, including basic information that is important to their welfare. She suggests that children's information needs can be conceptualized along the same lines as Maslow's hierarchy of needs ranging from basic physiological needs to the highest level of information need, self-actualization. She describes children as information-poor and sees children's lack of status in our society as well as the low level of communication between children and adults as two of the major barriers they face in meeting their information needs.

A study of computer use at home of 7-, 9-, and 11-year-olds revealed motivations such as curiosity, a desire to play games, and school work.^[7] The relationship between school work and computer use at home intensified with age. School work was a primary motivator for 11-year-olds, the second most important motivator for 9-year-olds, and least important among 7-year-olds.

A survey study of 641 fifth and sixth grade students in Taiwan,^[8] focused on information use, demonstrated that almost two-thirds of the respondents would seek information to cope with daily life problems. Information seeking behavior was more likely among older children and did not vary by gender. Students who felt their problems were outside of their control perceived information seeking as difficult or as requiring too much time, tended to avoid trying to find information to solve their problems. Among students who sought information, the author summarized reasons for seeking information as to solve a problem, to escape from thinking about a problem, to calm down and work toward a future transition out of the problem, and to affect a mood change that would help them feel better. Information seeking for many of these participants is

described as a process used to control emotions and as not necessarily requiring that problem itself be resolved.

Another scheme for identifying the information needs of children is offered by Shenton and Dixon^[9] who used qualitative methods with youth ranging in age from 3 to 18 years of age to determine who they go to when they consult people for information and what types of information they seek. Twelve categories of information needs were identified that included both the need for content as well as affective needs. These categories include "advice, spontaneous 'life situation' information, personal information, affective support, empathetic understanding, support for skill development, school-related subject information, interest-driven information, self-development information, preparatory information, reinterpretations/supplementations, and verification information" (p. 222).

Meyers et al.^[10] used a "Tween Day" methodology that included interviews and focus groups to study the information needs of children aged 9–13. They found that many of the information needs of this group were related to things that were currently going on in their lives and not long-term concerns. They wanted information to complete homework, for personal hobbies and interests, related social events, and popular culture. They also voiced a need for information about personal safety related to dealing with bullies and strangers, information about drugs and alcohol, and a strong need to share private information within a trusting relationship. These youth did not feel that they could necessarily expect that formal information would be available to help them with daily life concerns.

A study of the school and personal needs of high school students^[11] demonstrated that students are most likely to seek information for school-related reasons. However, they also sought information for information needs related to health, relationships, current lifestyle, and for making future plans. This study also revealed that students may consciously decide not to seek information, preferring to figure things out on their own, especially if they feel their concerns are subjective or unimportant, feel time pressures, or do not believe that relevant resources exist for their problem. Students also pointed to procrastination and denial as reasons not to seek information.

Agosto and Hughes-Hassell,^[12] using data from group interviews with urban young adults aged 14–17, developed a typology of the questions they identified as part of their everyday life information seeking (ELIS). The resulting categories support other research on youth information needs and include "schoolwork, time/date, social life/leisure activities, weather, daily life routine (e.g., meal and clothing selection), popular culture, current events, transportation, personal finances, consumer information, personal improvement (including self-help, college, and scholarship information), and job information" (p. 159).

Laplane^[13] used social network analysis to study the use of social networks among 15–17-year-olds seeking help with homework. Data were collected using in-depth

interviews with 19 students from public schools in Montreal, Canada. Respondents had a preference for people they had established relationships with (parents, friends) and who were convenient at the time information was being sought. Homework help was categorized as procedural help (how to perform a task), proofreading, comparing answers, factual (e.g., definitions, URLs), and executive help (described as copying someone else's work). Students who solicited help through social networking sites (SNS such as Facebook) tended to keep their help-seeking private by asking friends who were already signed on and using chat features rather than posting questions on their wall.

Special Populations

The information needs of special populations have also been the subject of investigations interested in youth. For example, Hamer's study^[14] focused on the information seeking of gay males related to disclosing their sexual orientation to others. Interviews were performed with young men in their late teens and early twenties revealing information needs related to understanding and forming their own gay identity, the decision to label themselves gay, and the consequences of self-identifying as gay. Participants reported periods during which they avoided these information needs, felt the need to conceal information seeking activities, and interacted with other young gay adults in online forums.

Hersberger et al.^[15] studied the information use environment of abused and neglected children aged 1–17 who had been removed from their homes. These children were found to first need information related to adjusting to their situation such as understanding what happened and why. After adjustment, children begin to grapple with the question of what is going to happen to them next. They cope with this question from the time of temporary placement until they are reunited with their family, placed with a relative, or moved into court-approved custodial care or possible adoption by a third party.

Agosto and Hughes-Hassell^[16] chose to study urban teens as this is a group that has not been given much attention in the literature. Urban—or inner city—teens have special circumstances in that they live in high-density areas of low socio-economic status and may lack strong role models, and libraries are in a good position to provide the information they need. They found that ELIS for these teens was centered on issues related to achieving adulthood in order to better understand themselves and the world. The researchers conceptualized urban teen information behavior as supporting development of the social self, the emotional self, the reflective self, the physical self, the creative self, the cognitive self, and the sexual self, and related these to a typography of 28 topics the teens' identified as areas of information need that they experience.

Koo^[17] investigated the information-seeking behaviors of newly arrived, high school-aged Korean immigrant youth in the United States. She wondered, given the importance of peers as an information source, how youth who had yet to establish relationships with peers compensate for this important resource. She found that during the period of social isolation their primary concern was doing well in school. They wanted information on how to improve their English in order to excel in class and better participate in school-related activities. They were also interested in developing social skills in order to make friends and to increase their comfort in American culture. These students demonstrated a strong preference for people when seeking information. However, in the absence of peers they relied on parents (mainly their mothers), teachers, and a do-it-myself attitude.

Lilley^[18] used mixed methods to study the information behavior of Māori students recruited from four secondary schools in New Zealand. A total of 139 students participated in a survey and 45 students participated in focus groups. The data reveal that these students prefer to seek information from people they personally know, such as friends, teammates, parents, siblings, extended family, and teachers. Students used opportunities in and around school to socialize and share information. Specific places where information exchanges take place were identified as school grounds, which includes restrooms, gym, organized sports practice, around the school shop (which sells food and school supplies), and the smoker's hangout. Information exchanged tended to center on social topics (e.g., music, film, gossip) and schoolwork.

INFORMATION SEEKING MODELS

Outside reference to developmental psychology, the use of theory to inform investigations of youth information seeking is limited. There are, however, three models of information seeking that have been widely referenced in this literature: Kuhlthau's information search process (ISP), Savolainen's ELIS, and Gross' imposed query model.

The ISP Model

The ISP model^[19] seeks to describe the constructive process of completing a research assignment by taking into account the cognitive, affective, and physical dimensions of information seeking. The research process is broken down into six stages: task initiation, topic selection, prefocus exploration, focus formulation, information collection, and search closure. At each stage, an assessment of the feelings, thoughts, actions, strategies, and mood of the information seeker are tracked demonstrating an interesting pattern of movement in which confidence grows as the thought process becomes increasingly specific and interest

grows as information-seeking actions become more specific.

The ISP has provided a useful framework for research and has informed interventions structured to help people gain information literacy skills. This model has been effective in bringing awareness of the role of affective response in information seeking and that recognition of uncertainty, confusion, and even frustration as a normal part of the process helps students deal with the uncertainty inherent in the process of refining a topic for study. It stands out in that it has been extensively tested in a variety of libraries and with a variety of users.^[20]

One example of a recent study of the ISP sought to understand the metacognitive knowledge of adolescents working through the ISP and the potential relationship between metacognitive knowledge and the cognitive, affective, and behavioral dimensions of the ISP.^[21] Using a think aloud protocol, Bowler was able to identify 13 metacognitive categories and to argue for teaching metacognitive strategies to students to support the development of information literacy skills.

Everyday Life Information Seeking

Everyday life information seeking^[22] brings into focus the world of information seeking that exists outside of work and school. The framework of ELIS is made up of two major concepts, way of life and mastery of life, and suggests how they manifest as approaches to information seeking. Way of life refers to how an individual has organized daily activities and prioritized them. Way of life describes the personal context an individual sees as “normal” and how they strive to maintain that condition. Mastery of life describes the individual’s ability to maintain an acceptable level of satisfaction with the way of life they have established. When things are going well, mastery of life may be a passive state. However, when problems arise or the way of life is threatened in some aspect, mastery of life may require an active stance to deal with whatever stimuli is being presented.

Like the ISP model, ELIS takes into account both the cognitive and affective nature of information seeking. However, the affective domain described by ELIS moves along a continuum of optimism versus pessimism concerning the prospect of being able to solve the information problem. It also points out that familiar information sources may not only be preferred, but their use may become so natural that they are not considered critically or considered in light of other resources or opportunities for information gathering.

One recent example of the application of ELIS to research on youth information seeking is the development of Agosto and Hughes-Hassel’s model of the everyday life information needs of urban young adults.^[16] The authors conclude that “the essence of teen ELIS is the gathering and processing of information to facilitate

the multifaceted teen-to-adulthood maturation process” (p. 1399). To demonstrate this, the model has as inputs seven variables related to a teen’s self-understanding that may work as motivators for information seeking: the emotional self, the reflective self, the physical self, the creative self, the cognitive self, the sexual self, and the social self.

Imposed Query

The imposed query is another model that has contributed to understanding of the information seeking process.^[23] This model differentiates between information seeking that is self-generated (the user who thought up the question also pursues the answer) and information seeking that is imposed (the user is acting as an agent by pursuing a response to questions given to them by someone else). Over 14 categories of imposer/agent relationships have been identified that result in imposed information seeking. The four most common imposers found in a study of adult reference desk use are children, instructors, spouses, and employers. A study of children aged 4–12 in an elementary school setting revealed that while teachers are the main imposers in this environment, the children also impose information seeking on teachers, parents, and other children.^[24]

A key point made by the imposed query is that there are many opportunities for the transaction of imposed queries to break down. Problems such as poor communication, beliefs and stereotypes about imposers, the nature of the relationship between the agent and the imposer, and the skill level of the person in the role of agent can all work against their successful resolution. To date, the imposed query model has been used to inform both research and practice in the areas of reference work, reference evaluation, investigations of youth and the Internet, information retrieval, information seeking, and the design of digital libraries.

A recent example of work that incorporates the imposed query is Bowler’s^[25] analysis of the development of student curiosity when working on a class assignment. Because of the specifications and time restraints that come with class assignments, students had to manage their level of personal interest, which could sometimes be a problem. While the development of personal interest helped to motivate students to complete the assignment, the assigned nature of the work can be at odds with fulfilling their developing personal interest. This put students in a position that can be both pleasurable and painful. Managing curiosity was a central concern when an imposed task begins to provoke self-generated questions.

YOUTH INFORMATION SEEKING BEHAVIOR

The research on the information seeking behaviors of youth is limited, but growing. Almost all investigations of

youth information seeking behavior have taken place in the context of school and are focused on the use of electronic resources. These studies have mainly been pragmatic in nature, focused on the performance of specific children in specific contexts mainly in response to school assignments. In addition, research has been more focused on searching behaviors than on information needs.^[9,26] Little is known about youth information seeking at home, in the public library, or in other information providing spaces. Likewise, little is known about the information needs and information seeking of very young children.

One issue that affects the information seeking of youth is the extent to which they have access to the resources they need to respond to their information needs. Young children may need help formulating their information needs and their access to information is often mediated, if not controlled by adults, if only to the extent that children often lack funds, transportation, and the independence to allow them the number of information options that adults enjoy. Issues of equity of access to information and services for youth in libraries are a continuing concern as challenges to materials, issues of filtering, inequities in information services for youth, and practices that discourage youth from interacting with librarians persist.^[27–30]

It is clear, however, that youth access to technology and the Internet continues to increase. Use of the Internet by youth at home, in the library, and at school is growing, and mobile devices are increasingly providing access to information for young people; however, equity of access for all youth remains a concern.^[31]

Resource Preferences

The resources used by youth to respond to both imposed and self-generated information needs can be summarized as people, the Internet, and books. Like other user groups, youth tend to go to the most accessible sources first, prefer people and resources available in the home, such as books they already own or computers they have access to. One characteristic of youth information seeking is a preference for the familiar. Children tend to prefer resources they have already interacted with whether these are print-based or electronic in format. The known story or website is generally preferred. Gradually, these preferences widen incorporating similar stories or subjects, books by the same author, and books of the same type or genre. Another issue, especially for children, is the high reading level at which many nonfiction texts are written and the difficulty of finding age-appropriate resources online. Children are very often required to use resources above their reading level when interacting with information resources.

People

In addition to the examples provided under the section, Youth Information Needs, Posten-Anderson and Edwards^[32]

investigated the information seeking of 13- and 14-year-old girls. They interviewed 28 girls and found them interested in information about relationships, school, and work. The girls revealed that factual information was the easiest to find, but that information needs that required interpretation were harder to satisfy. Likewise they felt school and work information was easier to find than information that would allow them to meet concerns about relationships. These girls did not see the school library as a place they could take their relationship concerns and preferred instead to talk to other people to try to satisfy these needs.

Agosto and Hughes-Hassell^[12] also demonstrated a preference among young people, of age 14–17 for using other people as information sources. However, librarians are not preferred resources for youth, who would rather consult friends and family. Preferred people^[9] include those who are convenient, such as parents and siblings; people youth recognize as having similar concerns, such as peers; and those believed to have expert knowledge, such as teachers. Stemmle and Ladd^[33] demonstrated that even very young children have the ability to recognize expertise in others and bring this type of critical thinking to bear in their choice of peer informants in their information seeking.

The Internet

A recent report by the Pew Foundation found that teens are heavy users of the Internet as compared to adults.^[34] Almost all youth aged 12 and over have cell phones, and about 75% of youth use mobile devices to access the Internet. Furthermore, while lower-income youth and youth from lower-education homes continue to have less access to the Internet, they “are just as likely and in some cases more likely than those living in higher income and more highly educated households to use their cell phone as a primary point of access” (p. 2). Studies are demonstrating that young adults are avid users of social media, and there is a call in the literature for further study of youth information behaviors related to virtual environments.^[35]

Studies concerned with youth access to the Internet mainly look at access in the schools and indicate that young people generally are not very skilled at using the Internet to find information.^[11,36–38] Vansickle^[39] wondered if academic track (i.e., technical, college preparatory, and honors students) would correlate with ability and asked students to self-rate their skills. Uniformly students said they taught themselves how to search the Internet or learned from friends, and they all believed their search skills to be sufficient. No difference was found related to academic track.

Bilal has performed several studies^[40–42] that look at children’s use of search engines for imposed and self-generated information seeking. Her studies reveal that young people do not have the skills they need to find

information easily and have a particularly hard time with questions that require them to retrieve information from more than one resource. Students were more satisfied with the process of answering self-generated questions than they were with retrieving information for imposed queries.

Recent research on the information literacy skills of first-year college students has demonstrated that while students are very confident about their ability to search, their actual skill level tends to be poor.^[43] The majority of first-year college students in these studies report having taught themselves to use the Internet or having learned from peers. However, they also cite classroom teachers, school and public librarians, and parents as people who have taught them information literacy skills. It is not clear to what extent young people are being taught to find, evaluate, and use information via formal instruction in grades K-12.

Of particular concern is the ability of youth to assess the credibility of digital resources. Because they often lack the skills and training needed to evaluate sources, they tend to rely on the design of web pages and how the information is presented rather than focusing on content.^[44]

Flanagin and Metzger^[45] used large-scale surveys to study differences in how adults (18 years and older) and young adults (ages 11–18 years) perceive the credibility of information across three online encyclopedias: Encyclopedia Britannica, Citizendium, and Wikipedia. Their results indicate that both groups are aware of Wikipedia, but that many are unclear as to how content on Wikipedia is supplied. Both groups recognize that content on Encyclopedia Britannica is more credible than content provided on the other two sites. However, both groups report using Wikipedia “sometimes.” Young adults are more questioning than adults of content presented as being from Wikipedia but rely heavily on contextual clues, such as recognition of the source, in making credibility judgments.

In a John D. and Catherine T. MacArthur foundation report^[46] related to the Flanagin and Metzger study, the authors found that children “consistently overestimate their own skill levels and capacity to discern good information from bad information as compared to others” (p. 106).

Books

It has been established since the 1940s that reading for fun declines with age, and that age 12 is a pivotal point at which recreational reading drops precipitously.^[24,47] However, traditional ideas of reading and of what a book is are variables that may need redefinition in reading studies to gain a full picture of what reading and writing look like for today’s young people. The high level of Internet use indicates that youth are reading online as well as using print-based works to respond to school assignments and to support personal information and recreation needs.

National surveys have been criticized for defining reading in ways that do not reflect actual reading practice.^[48] While there have been numerous surveys that have raised concern about the reading habits of the young, a 2009 National Endowment for the Arts survey^[49] demonstrated an increase in the amount of time spent reading, and a 2010 Kaiser Family foundation report^[50] demonstrated that heavy readers do better in school and that time spent “on screen” is not replacing time spent with print media.

A 2012 Pew report^[51] found that 83% of young people of age 16–29 had read a book in the last year, that young people read for imposed and self-generated reasons, and that E-books were more popular with 18–24-year-olds than among high school age youth. A 2014 Pew report^[52] discovered that people under the age of 30 are more likely to have read a book (includes all formats) weekly and over the course of a year, than those over age 30. Further young people are now “e-reading” at a rate similar to adults between the ages of 30 and 49.

Searching for Information

Early studies focused on children’s use of library catalogs revealed many barriers to their use, including lack of key-boarding, spelling, and vocabulary skills, as well as problems with Boolean logic.^[53,54] Children prefer to use natural language and need assistance formulating queries. They prefer browsing to searching and prefer searching library shelves to using the catalog to find books. Researchers have continued to be interested in assessing youth information seeking using electronic resources,^[55] and though there continue to be many gaps in the research, the findings tend to be consistent across studies. Research studies indicate that children and young adults need help formulating searches and benefit from formal training in information-seeking skills. Visual images help children compensate for low-level reading skills, and children perform better on interfaces designed especially for them that take into account limitations related to maturation and skill attainment.^[56,57]

While children and young adults can perform well on electronic interfaces, they tend to use them in a superficial way, often not taking advantage of advanced features, and overall their ability as information seekers tends to be low. Older children perform at a higher level than younger ones but do not necessarily attain competency in information seeking at school. The provision of formal information literacy instruction in primary and secondary schools is uneven, and studies^[43] have demonstrated that many entering college freshmen have nonproficient information-seeking skills. Interestingly, gender differences in computer use have almost disappeared. While the culture of computing between boys and girls may differ, the gap in skill levels appears to be closing.^[58]

Studies of children’s use of systems are complicated by the wide range of skills and maturity that youth

demonstrate. Early literature on children's use of information systems has limited usefulness as it often does not discriminate between developmental stages, does not assess skill with technology, and reflects use of systems that are now outdated.^[57] While information systems have been developed especially for children, some authors point out that the use of such systems is not always practical, nor necessarily responsive to individual needs.^[7]

Use of Reference Services

As with access to other resources, adults often mediate children's use of reference services in both the physical library and the virtual library. Adults play several roles in this respect, acting as role models, facilitating information seeking on the part of the child, and acting as agents for child users. The imposed query is common in reference work in the children's room. In fact, it is a common assumption that the majority of children's reference questions are related to schoolwork, although there is not sufficient information to know if this assumption is correct or not. Clearly, children have life situations and personal interests that can also be satisfied using library resources and that lead them to the reference desk. Because of the nature of traditional reference work, there is little documentation available to tell us what children are looking for when they seek assistance at the reference desk. Studies of children's use of computers in public libraries have demonstrated a high level of recreational use, such as for gaming.^[59,60]

Although it might seem that digital reference, which often provides a transcript of the reference transaction, would be able to answer some questions about the nature of reference services with youth, little work has been done in this area. Silverstein^[61] analyzed questions posed by youth (elementary through high school students) to science-oriented ASKA services and determined that 13% of these queries were not in response to school assignments but reflected self-initiated learning on the part of these users. Walter and Mediavilla^[30] reviewed virtual reference transactions between public librarians and young adults as part of an assessment of a homework help program. They found that 40% of these queries were referred to Live Homework Help because students asked for tutoring help. Other queries, represented as reference questions by users, were later referred for tutoring based on the librarian's assessment of the users need. The majority (60%) of the 114 queries identified as homework were math problems and only 8% were science topics.

Luo^[62] held focus groups with 36 teens aged 13–19 to learn about their use of text reference services. Only one teen was aware that the service was provided and none had used it. In projecting why they thought they would or would not use the service, participants felt they would most likely use it to satisfy an imposed query. However, they had concerns about the use of text reference related to

response time, interacting with librarians using a technology they perceived as meant for personal use, and the constraints of the technology itself. Here they were mainly concerned not only with cost, but also the limited number of characters, and concern that text reference might be limited to questions that had short answers.

Determining Relevance

Another important research question that has received limited attention is the ability of youth to determine the relevance of information resources to their search. Such judgments are connected to their ability to think critically about resources as well as to the amount of formal instruction they have received concerning the research process. Students have been shown to depend on title information, graphics, and book covers, when they have the book in hand, as the primary determinants of the relevance of a source to a search. In electronic searching, their confidence is increased when system terms match terms used in school texts.

In general, elementary grade children have difficulty assessing electronic sources. In Hirsh's^[63] study of fifth graders, she found not only that the students were interested in issues of authority, accessibility, and currency as well as the interest level of the material to themselves and their intended audience (their classmates), but also that students tended to stop searching as soon as they found an item that met the requirements of the assignment. Alexandersson and Limberg's^[64] study of 11-year-olds completing a school assignment about the sea demonstrated that these students saw information seeking as a procedure in which they searched for and then compiled and presented facts. Little attention was given to developing personal questions or understanding related to the topic. Students did not report much difficulty finding books in the library or using computers to find information, but the researchers observed that students did not use the library classification system to find works and often reported there was nothing available on the Internet for their topic. None of these studies are generalizable; however, they are consistent with other work that has demonstrated an inability among middle and high school students to assess resources and to connect what they find to what they already know.

YOUTH AS PARTICIPANTS IN RESEARCH

In 1986, Dervin and Nilan^[65] published a now classic article on information seeking that heralded a paradigm change from a system perspective to a user perspective in research and practice. While the important change in orientation documented by this article has had a widespread effect on research and professional work in libraries, it has had limited impact on youth services. The design and delivery of information services for children continue for

the most part to be seen as the purview of professional librarians, school library media specialists, teachers, parents, and other adults interested in child welfare.

As Walter^[6] makes clear in her research, there is an important logic to this. People do not always know what they need and children especially cannot be expected to be able to identify their own information needs in all areas. For example, they may very much need to know how to cross the street safely, but it may not occur to them without help, that this is something they need to know. Children do have their own ideas concerning what they want or need to know. They have their own interests and hobbies and can be articulate about their information needs and resource preferences.

In addition to the views of interested adults, the inclusion of youth in research, service design, and system development is increasingly recognized as important. Young adult advisory panels are increasingly used in libraries to help guide professional decisions concerning collection development and programming. Likewise, youth are increasingly participants, rather than just subjects, in research focused on their information behaviors. They are also being included as team members in the design and development of information technologies that are being created especially for them. However, these trends have yet to include very young children to a significant extent.

Perhaps, the most substantial example of the integration of youth in research and system development comes from the intergenerational design work by a research team at the University of Maryland. Using participatory design, this group has undertaken several innovative projects such as the SearchKids visual search interface and the International Children's Digital Library (ICDL).^[66] The inclusion of young people as full members of the design team has resulted in tools that help children search by providing the support they need in a developmental sense as well as responding to their search preferences. For instance, in addition to the typical searching functions such as keyword searching, the ICDL allows users to search for books in ways children expressed as useful, such as by the color of the book cover or by story length. The successes of this approach have influenced others not only to design technologies with children in mind, but also to include them in the design process. Examples include Bilal's efforts at Web portal design that use children as design partners^[67] and the use of intergenerational research teams described by Large et al.^[68,69] to visualize and develop consensus on the design of information technologies meant for children.

In terms of information services for children in libraries, the Project CATE model, developed with the support of the IMLS at the St. Louis Public Library, describes an outcome-based planning and evaluation process in which youth and other stakeholders are central.^[70] Stakeholders collaborate not only to make decisions about information and technology services, but also to agree on what the

target outcomes of services will be. Potential outcomes include changes in knowledge, behavior, skills, attitude, or status.

CONCLUSION

The information needs and information-seeking behavior of youth are two areas that continue to be ripe for investigations that will inform both research and practice. While a body of work is accumulating related to information seeking in school and information seeking with electronic resources, there are significant gaps in our knowledge and methodological issues that need to be addressed to build a solid research base. Youth information seeking in information spaces outside of school, the place of various media in youth information seeking, and the information needs of very young children are particular topics that need to be addressed. Increasing use of theory and the inclusion of youth are two continuing trends that are resulting in new insights and improved information services, systems, and resources that respond to the needs of this diverse population.

Zoological Park and Aquarium Libraries and Archives

Vernon N. Kisling, Jr.

Marston Science Library, University of Florida, Gainesville, Florida, U.S.A.

Abstract

Animal collections have existed since about 3000 B.C.; however, professional wildlife husbandry only began with the evolution of zoological parks in the early nineteenth century. This significantly increased during the second half of the twentieth century as the institutions, professional literature, and libraries matured together. Archives developed at a later and slower pace. Internationally, zoo and aquarium libraries and archives have progressed at varying rates in different countries depending on the profession's development in each country. Zoological park and aquarium libraries have services primarily concerned with the needs of their staffs. They have a specialized emphasis, reflecting the wildlife husbandry profession and its literature. As this body of literature grew, and the need for this literature became an essential part of the profession, libraries became increasingly important functions within zoos and aquariums. As these institutions grew older a sense of history encouraged them to establish archives and preserve their historic legacy.

INTRODUCTION

Zoological parks and aquariums have libraries primarily concerned with the academic and professional needs of their staffs. It is therefore important to understand the development of wildlife husbandry and the literature supporting this profession. Recognition of a need for libraries developed as the literature grew, became more sophisticated, and became a necessary part of learning the profession. Establishment of these libraries is viewed as an integral part of zoo and aquarium history and includes a review of the current status of libraries and library services in U.S. zoos and aquariums, along with a brief sampling of international zoo and aquarium libraries for comparison. Zoo and aquarium archives developed later and more slowly than the libraries. Establishment of these archives came out of a sense of history as the institutions grew older and reached significant anniversary milestones. The establishment of archives and their current status are discussed. The future of these libraries, archives, and their services is also considered.

ZOO AND AQUARIUM LITERATURE

Professional Development

Collections of living wild animals have been maintained since about 3000 B.C. when they first appeared in Mesopotamia, Egypt, and China. Central and South America explorers encountered New World animal collections in the early 1500s that had existed for a long time prior to their discovery. Likewise, early explorers in Asia found animal collections as well. Libraries have also existed for

an equally long time in societies that maintained animal collections, but having a specialized library as part of an animal collection is a more recent combination of activities.

Captive wildlife management during ancient times, and throughout most of our history, had its roots in domestication and farm animal husbandry. Keeping and domesticating wild animals began about 10,000 B.C., but collections of wild animals were not feasible until the development of the early, urbanized civilizations, which occurred about 3000 B.C. Wildlife husbandry remained a practical matter for a very long time and did not differ to any great extent from agricultural husbandry until the animal collections (later known as menageries) developed into modern zoological parks during the early 1800s.^[1,2]

Neither agricultural nor captive wildlife husbandry, despite several thousand years of activity, developed an organized body of knowledge that could be taught or systematically improved upon until the nineteenth and twentieth centuries. Difficulties existed for those who tried to establish academic and professional foundations in these professions, since it was felt that animal husbandry was a practical matter, not a scientific one, and what had to be learned could be taught verbally by word of mouth. Veterinary medicine and zoological park management suffered a similar fate.

Modern zoological park management began with the transition of European menageries into zoological parks, especially with the opening of the Zoological Society of London's zoo in 1828. Other important early European collections included Tiergarten Schonbrunn, Vienna (1752); Menagerie du Jardin des Plantes, Paris (1793); Zoologischer Garten, Berlin (1844); Natura Artis Magistra, Amsterdam (1838); and Zoologischer Garten

Breslau, Germany, 1865 (now Miejski Ogród Zoologiczny, Wrocław, Poland). Modern aquariums are a more recent development. The first public aquarium was built at the London Zoological Gardens in 1853, and others appeared soon afterward in Europe and the United States.

Exotic wild animals have been exhibited in the United States since 1716, traveling menageries since the early 1800s, and small urban menageries since the 1860s. However, the first modern U.S. zoological park was the Philadelphia Zoological Garden, chartered in 1859 and opened in 1874. After the American Civil War, public and professional consensus favored improved collections and higher standards of animal care. Throughout the decades of the late 1800s and the 1900s, there continued to be improvements in many areas affecting zoos: in community standards for cultural institutions, in the aesthetic sensibilities of the public, in the educational level of the populace, in the level of scientific knowledge, in the conservation of wildlife, in the overall standard of living, and in the expertise of zoo and aquarium staffs. This period was also a time when many occupations, including wildlife husbandry, became professionalized.

Professional zoo associations began forming after the first association, the Verband Deutscher Zoodirektoren (Association of German Zoo Directors), was established in 1887. An American zoo and aquarium profession was formerly recognized with the founding of the American Association of Zoological Parks and Aquariums [AAZPA, now the Association of Zoos and Aquariums (AZA)] in 1924. With a professional association came a professional code of ethics, professional registration of individuals, and professional accreditation for institutions. Improvements in all aspects of administration and animal husbandry were made during the twentieth century, and these improvements intensified in the period following World War II. During the 1960s, there was a significant increase in the professional literature and the number of zoo and aquarium libraries. The decades of the 1970s and 1980s were a time when zoos and aquariums recognized the need for archives (at least in the United States; zoos and aquariums in Europe recognized this need earlier). As several U.S. zoos and aquariums reached their centenaries and the AZA reached its 75th anniversary, a sense of history began to permeate the profession, along with a better appreciation of libraries and archives. Even so, some zoos and aquariums still do not have these facilities, or they have operations that are not appropriately maintained and funded.

GROWTH IN THE PROFESSIONAL LITERATURE

Although the practice of wildlife husbandry at any point in time was appropriate for the time in which it occurred and although it steadily improved over time, there was little in

captive wildlife husbandry to inspire the development of its literature and little in the literature to promote the development of wildlife husbandry during most of its history. In so far as literature is an indication of a profession's development, it appears that the zoo and aquarium profession evolved significantly during and after the 1960s.

Prior to the 1960s, zoos and aquariums improved professionally but at a slower rate that was in keeping with the times. The first U.S. zoo research facility, the Penrose Research Laboratory, began about 1901–1905 at the Philadelphia Zoological Garden, the first zoo veterinary clinic was set up in 1916 at the New York Zoological Park, the first zoo field research station was established in 1916 by the New York Zoological Society, and the New York Zoological Society began publication of the first scientific journal for zoo-based wildlife research, *Zoologica*, in 1907.

Internationally, the Frankfurt Zoological Society began publishing the first zoo journal, *Der Zoologische Garten*, in 1859; the Director of the Calcutta Zoo wrote the first modern book on captive wildlife management, *A Handbook of the Management of Animals in Captivity in Lower Bengal*, published in India in 1892; *International Zoo News* began publication in 1954; and two regionally important zoo journals in Germany and Poland were founded in the 1950s. In addition, as Table 1 indicates, a tremendous increase in the professional literature took place after 1960, led by the all-important publication the *International Zoo Yearbook*.^[3]

With continual changes and improvements in wildlife husbandry taking place, the 1960s was the decade when it became clear to many that word-of-mouth training was no longer adequate. Formal training and published information were starting to be recognized as important to the profession's improvement. In addition to commercial publications, there were publications from the institutions and their support organizations, as well as publications from the professional associations (which have now grown to 40 national, regional, and international associations according to the 1998 *International Zoo Yearbook*). In 1978, a Librarians Special Interest Group was formed within the Association of Zoos and Aquariums to coordinate efforts at improving zoo and aquarium library services and to help the association with library-related matters. One of their projects was to sift through the huge increase in professional literature that had developed by the 1980s in order to list the core literature that was considered essential to have in zoo and aquarium libraries.^[4]

This large body of literature developed because there was a need for it. Wildlife husbandry information had become recognized as a necessary part of the work. Providing a boost to this recognition was the *International Zoo Yearbook*, published annually since 1960 with articles on every aspect of zoo, aquarium, and wildlife husbandry management. This publication, along with *International Zoo News*, provides a worldwide historical glimpse into

Table 1 Significant publications related to the wildlife husbandry profession.

1859–	<i>Der Zoologische Garten</i> (Frankfurt Zoological Society). This is a journal providing national and regional zoo research and news.
1892	<i>A Handbook of the Management of Animals in Captivity in Lower Bengal</i> . R.B. Sanyal (Bengal Secretariat Press; Calcutta, India). The earliest known book (in modern times) concerned with captive bird and mammal management.
1897–	<i>Wildlife Conservation</i> (Wildlife Conservation Society/formerly New York Zoological Society). Formerly <i>Animal Kingdom</i> (1942–1990), and before that the <i>Journal</i> (of the NYZS) and <i>Bulletin</i> (of the NYZS) (1897–1942). A popular magazine containing information about zoos and natural history articles.
1907–	<i>Zoologica</i> (New York Zoological Society). This was a scientific journal that provided wildlife husbandry and natural history contributions from the Bronx Zoo staff. In its later years, it was intended to be a research journal for the American zoo community, but this was not accomplished.
1923	<i>Disease in Captive Wild Mammals and Birds</i> . Herbert Fox (Lippincott: Philadelphia, PA). This is the earliest known book (in modern times) on the diseases of captive wildlife. It is based on work done at the first American zoo research center, the Penrose Research Laboratory, Philadelphia Zoological Garden.
1926–	<i>ZooNooZ</i> (Zoological Society of San Diego). A popular magazine containing information about zoos and natural history articles.
1932	<i>Zoological Parks and Aquariums: An Annual Assemblage of Information and Facts</i> (American Association of Zoological Parks and Aquariums/AAZPA, now the AZA). Despite its title, only this one volume of articles and facts about zoos was published.
1950	<i>Wild Animals in Captivity</i> . Heini Hediger (1964, Dover reprint: New York). The first of three books by Hediger concerning the basic principles of wildlife husbandry.
1954–	<i>International Zoo News</i> (John Aspinall Foundation: Chichester, UK). The most significant resource for news and information on the world's zoos and aquariums.
1955	<i>The Psychology and Behavior of Animals in Zoos and Circuses</i> . Heini Hediger (1968, Dover reprint: New York).
1957–	<i>Przegląd Zoologiczny</i> [Zoological Review] (Polish Zoo Association: Wrocław, Poland). This is a national scientific journal of regional and international importance.
1958–	<i>Zeitschrift des Kölner Zoo</i> [Journal of the Cologne Zoo] (Zoologischer Garten: Köln, Germany). This is a scientific magazine of regional and international importance.
1960–	<i>International Zoo Yearbook</i> (Zoological Society of London: London, UK). An annual serial with articles on all aspects of zoos, aquariums, and wildlife husbandry, this is the most important reference resource for the profession. It also includes statistical information on zoos, aquariums, and their wildlife collections covering 1959 to the present.
1960–	<i>AZA Communiqué</i> (American Zoo and Aquarium Association/AZA). Formerly the <i>AAZPA Newsletter</i> (1960–1991) and <i>AAZPA News</i> (1924–1960).
1964	<i>The Management of Wild Mammals in Captivity</i> . Lee S. Crandall (University of Chicago Press: Chicago, IL). This is the second known book on captive mammal management.
1964–	<i>Dodo</i> (Jersey Wildlife Preservation Trust: Jersey, Channel Islands). An annual journal with scientific articles written about the zoo's collection and its conservation programs in the wild.
1968	<i>Zoological Park Fundamentals</i> . Lawrence Curtis (AAZPA). First known book summarizing the philosophy, planning, design, and administration of zoos. A substantially revised and enlarged edition, <i>Zoological Park and Aquarium Fundamentals</i> , was published in 1982 (Karen Sausman, Ed.).
1968–	<i>AZA Annual Conference Proceedings</i> (AAZPA/AZA).
1968–	<i>AAZV Annual Proceedings</i> (American Association of Zoo Veterinarians).
1968	<i>Zookeeper Training: A Suggested Guide for Instructors</i> (AAZPA). A manual for formal institution-based zookeeper training courses.
1969	<i>Man and Animal in the Zoo</i> . Heini Hediger (Delacorte Press: New York).
1970–	<i>Journal of Zoo and Wildlife Medicine</i> (AAZV). Formerly the <i>Journal of Zoo Animal Medicine</i> (1970–1988).
1972	<i>General Principles of Zoo Design</i> . Geoffrey Schomberg (Lutra Consultants: London, UK).
1973–	<i>AZA Regional Conferences Proceedings</i> (AAZPA/AZA).
1974–	<i>Animal Keepers Forum</i> (American Association of Zoo Keepers/AAZK). The monthly magazine of the AAZK.
1974–	<i>National AAZK Conference Proceedings</i> (AAZK).
1975	<i>Zoo Design: International Symposium on Design and Construction</i> (Paignton Zoo and Botanical Gardens: Paignton, UK). Additional proceedings were published in 1976 (<i>Zoo Design</i> 1), 1980 (<i>Zoo Design</i> 2), 1982 (<i>Zoo Design</i> 3), and 1989 (<i>Zoo Design</i> 4).
1975	<i>Capture and Care of Wild Animals</i> . E. Young (Curtis Books: Hollywood, FL).
1975–	<i>Breeding Endangered Species in Captivity</i> . R.D. Martin, Ed. (Academic Press: New York). Proceedings of the first conference on captive breeding programs. Subsequent proceedings have been published in the <i>International Zoo Yearbook</i> and elsewhere.
1976	<i>The Chemical Capture of Animals</i> . Antoine Harthoorn (Bailliere, Tindall: London, UK).
1977–	<i>Bongo</i> (Zoologischen Gartens Berlin). This is a scientific magazine of regional and international importance.
1977–	<i>International Zoo Educators Journal</i> (International Association of Zoo Educators).

(Continued)

Table 1 (Continued)

1978	<i>Zoo and Wild Animal Medicine</i> . Murray Fowler (Saunders: Philadelphia, PA).
1978	<i>Restraint and Handling of Wild and Domestic Animals</i> . Murray Fowler (Iowa State University Press: Ames, IA).
1978	<i>Behavior of Captive Wild Animals</i> . Hal Markowitz and Victor Stevens (Nelson-Hall, Chicago, IL).
1982–	<i>Zoo Biology</i> (Wiley-Liss: New York). A scientific journal, independently published, but in cooperation with AZA, devoted to research conducted at zoos and aquariums.
1980s +	Important professional publications increased during the 1960s and 1970s, as these examples indicate. The number of publications, however, increased significantly during and after the 1980s, and there are far too many to list here. These more recent publications include both commercially published titles and professional association titles. Not included in this list are the numerous magazines and newsletters published by associations that support each zoo and aquarium.

the profession as it developed during the second half of the twentieth century, including the development of species ecology, animal behavior, reproductive physiology, genetics, small population biology, veterinary medicine, nutrition, exhibit architecture, education, conservation, public relations, fund-raising, and administration. Along with a recognized need for publishing this professional literature, there came a recognized need to access and store it.

ZOO AND AQUARIUM LIBRARIES

Recognizing the Need for Libraries

United States libraries have existed since the colonial period, and about the time of independence there were some 133 libraries in existence. By the time the first zoological park opened in 1874, there were some 5817 libraries in the United States. However, few of those were specialized and only about 123 (2%) were devoted to science and technology, and none were then found in zoos.^[5] In contrast, natural history museums and botanical gardens have been established in the United States since the 1700s. With their emphasis on the scientific aspects of zoology and botany, these institutions were more dependent on the scientific literature to support their work and research. U.S. zoos, on the other hand, evolved out of popular entertainment and education; a more public-oriented, rather than a research-oriented, evolution. Early zoo work consisted of practical animal husbandry rather than taxonomic studies and scientific research. These developments delayed the need for a body of professional literature, the establishment of libraries to hold this literature, and the use of archives to preserve this literature. But all of this was to change as the profession emerged during the twentieth century.

Some zoos and aquariums did recognize the need for libraries early in their existence. Individuals, such as medical doctor R.W. Shufeldt, traveled widely and were familiar with zoological parks, and they held their own opinions on how these institutions should be organized and administered. In 1889, Shufeldt published his ideas, including the following opinion on libraries:

No well-appointed zoological building in connection with a garden would be complete without its reading room and library. In the latter should be found, in time, all the standard works that have appeared upon the various branches of natural science, and more particularly upon vertebrate zoology and morphology, including, of course, such subjects as classification and geographical distribution of animals, and the reports of other zoological gardens and societies. On the reading tables should appear the various authoritative zoological periodicals of the day, and bound volumes of the same should be upon the library shelves.^[6]

Expressing the need for zoo libraries and achieving their establishment were two different matters, even for the large, better financed institutions. Shortly after the New York Zoological Park (the Bronx Zoo, now the Wildlife Conservation Park) had opened in 1899, its director William T. Hornaday complained to Andrew Carnegie about his lack of support, especially since the zoo’s need for several buildings, including a library, were financially pressing matters for the zoo:

From the beginning it has been my fond hope that the ‘Model Millionaire’ would set the example for the other leading men of New York by giving a complete equipped building. Yes, I know that you have given us \$5000—as much as anyone has given. But of our Managers, no other is giving away millions, and almost forgetting us! If you could see how our buildings are crowded with eager people every Sunday when the toilers can come, and note how eager they are to enjoy our beautiful wild creatures, surely we would fare as well at your hands as the people of Emporia and Tucson.^[7]

Those libraries that did emerge at zoos and aquariums developed independent of the mainstream library profession in America. They were part of the zoo and aquarium profession and followed zoo and aquarium programs. Even the librarians’ organization (the Librarians Special Interest Group) is a committee-like group within the Association of Zoos and Aquariums, whereas the botanical garden librarians have an independent organization (the Council on Botanical and Horticultural Libraries) and the natural history museum librarians (the Natural History

Caucus) are affiliated with the Special Libraries Association. The disadvantage of developing within the zoo and aquarium profession has been the competition with other programs and activities within the zoos and aquariums for recognition. However, the advantage is that there is a close working relationship between the librarians and the animal staff at zoos and aquariums.

Establishing the Early Libraries

Shortly after the Zoological Society of London was founded in 1826, it resolved to not only establish a collection of living animals (founded in 1828) but also a museum of preserved animals, and a library. The first books for the library arrived in 1827. By 1964, when many U.S. zoo and aquarium libraries were just getting started, there were 120,000 volumes in the Zoological Society of London's collection and the library needed rebuilding and modernization. Because of its collection size and maturity, the library's influences have been significant. Most specially, its resources have been used to develop the world's foremost index to the zoological literature, the *Zoological Record*.^[8]

Table 2 Earliest American zoo and aquarium libraries and archives.

	Year established		
	Zoo/aq.	Library	Archives
Philadelphia Zoological Garden [1 st zoo]	1859	?	?
Central Park Zoo (WCS ^a)	1861	1900	?
Lincoln Park Zoo	1868	?	1979
Cincinnati Zoo	1875	?	1970
Ross Park Zoo	1875	?	1988
Baltimore Zoo	1876	?	1980
National Zoological Park	1889	1898	1898
Zoo Atlanta	1889	?	1988
Prospect Park Zoo (WCS)	1893	1900	?
Seneca Park Zoo	1894	?	1976
Denver Zoo	1896	?	1988
New York Aquarium (WCS)	1896	1900	?
Bronx/New York Zoo (WCS)	1899	1900	?
Toledo Zoological Gardens	1900	1937	?
Chaffee Zoo	1908	1950	1965
San Antonio Zoo	1914	1929	1968
San Diego Zoo	1916	1916	1916
Cheyenne Mountain Zoo	1926	1927	?
Detroit Zoo	1928	1950s	?
Tulsa Zoo	1927	?	1976
Mesker Park Zoo	1929	1945	?
Shedd Aquarium	1930	?	1985
Brookgreen Gardens Zoo	1931	1931	1931
El Paso Zoo	1941	1956	1970s
Pittsburgh Aviary	1952	1952	?
Cameron Park Zoo	1955	?	1976
Indianapolis Zoo	1964	?	1988

^aWCS = Wildlife Conservation Society (formerly New York Zoological Society), which serves all of these zoos and aquariums with a central library and archives.

Only 15 libraries were established in U.S. zoos and aquariums prior to 1960, as Table 2 indicates. However, the establishment of a library within an institution is a difficult matter to determine and many zoo librarians (or zoo directors) simply do not know when their libraries began. As the latter decades of the 1900s progressed, accumulations of books, journals, and newsletters began filling shelves in directors' and curators' offices. These publications were often not organized, or recognized, as libraries. Many directors, curators, and keepers had their own personal libraries at work or at home, or they had access to local public and university libraries. This may have diminished the perceived need for an institutional library, but eventually, the quantity of specialized literature made it too difficult for each individual to expand their own libraries and made institutional libraries more of a necessity.

Transforming an accumulation of publications into an institutional library, however, is often a gradual process rather than one that occurs at a discernable point in time. Another problem with defining these libraries has been a lack of understanding within the zoo and aquarium community of how a professional library should be managed or that libraries are managed according to standards established by another profession. In addition, AZA accreditation standards for zoos and aquariums have not required these institutions to have in-house libraries. Nevertheless, the accreditation standards do stipulate that zoo and aquarium staff must have access to an appropriate local library. Accepting the appropriateness of the local library and its use is at the discretion of the accreditation review team.

While the decades of the 1960s and 1970s witnessed an upsurge in the establishment of zoo and aquarium libraries, the remaining decades of the twentieth century saw improvements in the professional management of the libraries. The AZA Librarians Special Interest Group was established in 1978 and began publishing a newsletter, *Library News for Zoos and Aquariums*, in 1982. A directory of zoo and aquarium libraries is published periodically, as is a core list of recommended publications, a set of guidelines for operating libraries, a procedures manual, and a union list of journals and zoo newsletters.^[4,9–12] Several surveys and articles review the progress of zoo and aquarium libraries in the 1980s, including a special issue of *Science & Technology Libraries*.^[13–16] The *Directory of Zoo and Aquarium Libraries* provides much of the information gathered in these surveys.^[9] These data have also been reviewed in two previous *Encyclopedia of Library and Information Sciences* articles.^[17,18] A 2008 online survey by the Librarians Special Interest Group brings the data up to date.^[19]

Current Status and Services of the Libraries

Zoo and aquarium libraries vary greatly in size and functionality from institution to institution. Being specialized

they encompass the breadth of staff activities at these institutions, including business administration, personnel administration, financing and fund-raising, public relations, legislative matters, visitor surveys and demographics, buildings and grounds maintenance, garden and landscaping, master planning, exhibit designing, labeling and graphics, education, animal management and nutrition, veterinary medicine, genetics and biotechnology, reproductive biology, conservation, small population biology, and in situ field ecology.

Professional zoo librarians with a master's degree in library science are still few in numbers. Many zoos and aquariums rely on non-MLIS librarians (some of which have other degrees), part-time librarians, office staff, or volunteers to maintain their collections. Because of a loose interpretation of what constitutes a library, survey results have differed. A 1981 survey indicated that 104 zoos had libraries; however, a 1984 survey, using the presence of a professional librarian and information services as criteria to define a library, reduced that number to only 40.^[13,14] A 1988 survey, using a full-time professional librarian, circulation of the collection, and information services as criteria for defining a library, found that only 11 zoos had what could be considered full-service libraries.^[15] According to the 1988 survey's total responses, 12 zoo and aquarium libraries were established prior to 1960, 14 were established during the 1960s, 27 during the 1970s, and 19 during the 1980s.

The *Directory of Zoo and Aquarium Libraries* for 2000 lists 43 U.S. libraries and 12 international libraries while a more recent 2002 edition lists 34 U.S. and 9 international libraries.^[9] The U.S. libraries listed in this directory are the primary libraries among those that exist at the 218 accredited U.S. zoos and aquariums. An analysis of the information these libraries provide in the directory reveals how the more professionally active American zoo and aquarium libraries are doing. Three large library systems exist: the Steinhart Aquarium Library is a branch of the California Academy of Sciences Libraries; the National Zoological Park Library is a branch of the Smithsonian Institution Libraries; and the various libraries at New York City zoos are part of the Wildlife Conservation Society (formerly New York Zoological Society) library system. One of these libraries is not considered in the following analysis because it provided statistics for the larger system of which it is a part. The international libraries listed in the directory represent a very small random selection but will be considered nevertheless (like the various surveys, providing information for the directory is voluntary, and the directory is not meant to be a comprehensive listing of all libraries). The 2008 survey included 73 U.S. and international zoo and wildlife libraries.^[19]

The 2000 directory and 2008 survey provide different kinds of data, so both will be briefly reviewed here.^[9,19] Out of the 42 U.S. zoo libraries listed in the directory, 35 have a librarian (with a variety of titles) or someone who serves as a librarian (perhaps a zoologist, but more often

someone from the education department). In the survey, there are three libraries with more than one librarian and 10 have only half-time librarians. The survey also indicates that 16 librarians have professional librarians with an MLIS degree. Budgets vary (when there is one), but in 2008 tend to be in the \$1000–5000 range.

Collections vary greatly in size. Based on the directory data, 7 have fewer than 1000 books in their collection, 7 have 1000–1999, 16 have 2000–3999, and 11 have more than 4000 (one did not provide this information). The larger book collections are those at Brookfield Zoo (with 15,000 books), San Diego Zoo (12,000), Shedd Aquarium (10,000), Bronx Zoo (7500), and the National Zoo (6500). Twelve subscribe to less than 30 journal titles, 6 have 30–49, 9 have 50–99, 11 have 100–200, and three have more than 200 (one did not provide this information). The larger journal collections include those at San Diego Zoo (850), Brookfield Zoo (310), and Bronx Zoo (210). The survey data indicates that most book collections are in the 1000–10,000 range and that online journal subscriptions, while few, are increasing.

Special collections listed by the libraries include zoo and aquarium newsletters, zoo and aquarium annual reports, studbooks, guidebooks, vertical files, graphic material, slides and photographs, video and DVDs, newspaper clippings, reprints, teacher resource materials, children's bookshelf, staff publications, maps, oral histories, and informational CD-ROMs. As of 2008, 18 specifically mention having archives and four libraries have rare book collections.

Library services usually include interlibrary loan (21 libraries in 2008) and online catalogs (11 libraries in 2008). Reference is always provided at those libraries with a librarian, but often it is only for the staff (limited reference is provided to the public over the phone or if the public is allowed to use the library). Other services include current awareness bulletins, new acquisitions newsletters, compiling bibliographies, providing book reviews, and routing journals or journal contents. Electronic databases provided at the libraries include Aquatic Sciences and Fisheries Abstracts, Biosis, CAB, Dialog, Fish and Fisheries Worldwide, OCLC (as a database and 11 libraries use it for cataloging), PubMed, Species Information Library, Wildlife and Ecology Worldwide, Web of Science/Knowledge, and Zoological Record. In 2008, digital projects became more commonplace (at 18 libraries) as did consortia and listserv memberships.

In 2008, there were 23 libraries open to the public. Library users always include staff, usually include society members and docents, and sometimes include the public. Of those zoos and aquariums allowing the public to use their library in 2000, all but one required appointments. Other users mentioned include researchers, interns, teachers, and students.

Although the 2000 sample of international zoo and aquarium libraries is random and small (12 libraries), it

may be of interest to review their statistics. All 12 have a librarian. Two have book collections in the range of 1000–1999, 5 in the range of 2000–3999, and 5 have more than 4000. The largest book collections are at the London Zoo (with 170,000 books), Berlin Zoo (12,200), and Melbourne Zoo (10,000). Two have subscriptions to less than 30 journal titles, 4 have 50–99, 4 have 100–200, and 1 has more than 200 (one did not provide this information). The largest journal collection is at the London Zoo (with 1300 titles). Seven provide interlibrary loan service, and 5 provide online searching. Their library users include staff (at 12 libraries), society members (at 9 libraries), and the public (at 10 libraries, 8 of which require appointments).

ZOO AND AQUARIUM ARCHIVES

A Sense of History and the Need for Archives

Zoo and aquarium archives evolved over time as materials accumulated and a sense of history emerged. Just as some institutions consider an accumulation of books to be their library, some consider the storage of older material to be their archives. Of those institutions surveyed in 1989, 11 did not know when their archives were established, 5 archives began during the 1960s, 6 during the 1970s, and 6 during the 1980s.^[20,21] Of the 43 libraries listed in the *Directory of Zoo and Aquarium Libraries*, only 8 mentioned having archives.^[9] Of the 73 institutions surveyed in 2008, 18 indicated they had archives.^[19] Among the total number of zoos and aquariums, only a relatively small number of archives exist. Primarily, this is because many institutions still do not understand what archives are, why they are needed, or their value. Zoo and aquarium librarians who do understand and appreciate the need for archives have difficulty getting and maintaining support for them.

Archives began receiving more attention within the profession during the 1990s, although it is not clear how many new institutional archives were established during this time. Archives were established for the Association of Zoos and Aquariums during this time and are located at the Smithsonian Institution Archives, which also houses the archives of the National Zoological Park and the International Union of Directors of Zoological Gardens. An introductory workshop to archives, document retention, and preservation was held at the 1999 annual AZA conference, with help from a representative of the Minnesota Historical Society, State Archives Department (which houses the archives of the Minnesota Zoo). This attention to archives at the national level was helped in part because the AZA celebrated its 75th anniversary in 1999 and in part by the efforts of the AZA History Committee, which was established in 1991. In addition, a number of U.S. zoos and aquariums have recently reached their centennials and several more will do so soon. This milestone often imparts a sense of history that in turn provides an interest in preserving historical documents.

Current Status and Services of the Archives

Although there have no doubt been changes since the 1989 in archives surveys, no newer information is available, so the analyses from these surveys will be reviewed. The archival material found at zoos and aquariums is often the same found at any other institution, including staff and administrative records, reports, correspondence, photographs, newspaper articles, and memorabilia. Also included, though, are rather unique materials, such as animal inventories, studbooks, veterinary records, animal husbandry record books, and wildlife research records.

Of the 28 archives surveyed in 1989 (which is 36% of the 78 zoos and aquariums with libraries surveyed separately in 1988 and 13% of the 218 U.S. zoos and aquariums accredited in 2008), archivists or librarians managed only eight of these facilities. Ten archives had 2 or 3 full-time individuals working with the collection, whereas 8 had only one full-time person. The other archives used part-time help or volunteers. Ten of the collections had been cataloged, 21 had material available for study, and 6 had restored their material. Most provided limited access to the archival collections. Nineteen contained material dating back to the establishment of the institution, and of these 7 were zoos established prior to 1900. To what extent these collections are housed under proper climate control is not known. Some collections are maintained on site at the institution, whereas others are housed at municipal archives or at local and regional historical society repositories. The National Zoological Park archives are housed at the Smithsonian Institution Archives because it is a branch of the Smithsonian Institution. The Minnesota Zoo archives are housed at the Minnesota Historical Society, State Archives Department, because it is a state institution. While only 18 institutions surveyed in 2008 said they had archives, this number is probably a more realistic recognition of well-managed archives (8% of the 218 zoos accredited in 2008; however, this survey also included some international zoos and wildlife conservation institutions).

CONCLUSION

Interest in archives will increase as more U.S. zoos and aquariums reach their centennials and develop a sense of history. This milestone is not as significant in Europe where, for example, the Schonbrunn Zoo (Vienna) celebrated its 250th anniversary in 2002. European zoos and aquariums, as well as other world zoos and aquariums, have extensive archives. Unfortunately, too much material from zoos and aquariums has already been lost. In addition, there are many zoos and aquariums that have closed with little or no trace of their existence. In the United States some 250 zoos and aquariums are known to have closed since the first zoo opened.^[22]

Interest in the history of zoos and aquariums is increasing as well. A number of graduate research theses and

dissertations have recently been completed on the cultural history of zoos and aquariums and the Bartlett Society, an international society for the study of zoo and wild animal husbandry history, was founded in 1984. Several institutional histories have been published recently, as have two history books, essentially the first since Gustave Loisel wrote *Histoire des Menageries de l'Antiquite a nos jours* (Octave Doin et Fils and Henri Laurens, Paris) in 1912.^[1,2] There is still much to be learned and documented. As Ken Kawata points out in his historical commentaries, many in the zoo profession do not even know the names of individuals who made important contributions to the profession in the past, or what those contributions were.^[23,24]

There is still a need to stabilize and improve the quality and quantity of libraries as well. After some 5000 years of practical animal husbandry, the keeping of wild animals has come of age quickly. And as zoological parks and aquariums continue to evolve, their libraries and archives are destined to play a larger role within the institutions and the profession, providing the increasingly sophisticated information needed by the profession and preserving what is left of the historical records.

ACKNOWLEDGMENTS

The Librarians Special Interest Group and the Association of Zoos and Aquariums have made significant contributions to the development and professionalization of zoo and aquarium libraries and archives. They have also been responsible for gathering information about these libraries in order to benefit and improve the services these libraries provide.
